

THE CHEMICAL FOOTPRINT PROJECT SURVEY

2018 Guidance Document

THE CHEMICAL FOOTPRINT PROJECT SURVEY 2018 Guidance Document

Cheri Peele, MCP
Sally Edwards, Sc.D.
Mark Rossi, Ph.D.

October 31, 2018

*The Chemical Footprint Project (CFP) is a project of Clean Production Action.
The founding organizations of CFP are Clean Production Action, Lowell Center for Sustainable Production
at the University of Massachusetts Lowell, and Pure Strategies.*

ACKNOWLEDGMENTS

The Chemical Footprint Project (CFP) envisions a world where chemicals are healthy for people and the environment; where chemically related disease rates for cancer, infertility, asthma, and learning disabilities are low; and where consumer, government, and business demand drives the widespread supply of safer products. To achieve this vision the Chemical Footprint Project was created to benchmark and share data on corporate progress to safer chemicals in products, manufacturing, and supply chains.

CFP and this *2018 Guidance Document* emerged from over a decade of work by many individuals committed to creating a systemic approach to evaluating and benchmarking corporate performance in chemicals management. We wish to acknowledge everyone who has played a role in advancing this work.

The members of the BizNGO Chemicals Work Group continue to provide valuable input into the CFP. We are also grateful to 2017 Survey responders for their thoughtful feedback and suggestions to improve clarity and usability.

We also thank Erin Gately and Patty Dillon of the Green Electronics Council for their analysis of the alignment of the CFP Survey questions and the standards used by EPEAT.

We recognize that the tool still has flaws, for which we take full responsibility. Being practitioners of the ethos, “don’t let the perfect be the enemy of the good,” we look forward to continuing to improve the Survey in future iterations.

In producing the report, we tip our hat to David Gerratt of DG Communications for both his continuous patience and creativity in design. For her work in getting the Survey online, we thank Bree Rodrigues of eBree Design for her patience and attention to detail. We also thank Ellen Goldberg and Alison Poor of Clean Production Action for their behind the scenes work in editing and shepherding the document to completion.

Alignment of the CFP Survey with Other Sustainability Frameworks

Guidance for Completing the Chemical Footprint Project (CFP) Survey

INTRODUCTION

Increasingly, purchasers and investors want to know how companies manage chemicals in their products and supply chains. Are companies using chemicals of high concern to human health or the environment in their products or manufacturing? Are they using safer alternatives? What actions are companies taking to systematically reduce chemicals of greatest concern and use safer alternatives? How can companies that have developed systems for chemicals management, reduced the use of chemicals of high concern, and implemented safer alternatives be identified and rewarded?

The Chemical Footprint Project (CFP) Survey sets a new standard for evaluating and comparing companies on their policies, programs, and practices for managing chemicals. It assesses companies on their overall progress in avoiding chemicals that may cause adverse health effects such as cancer, birth defects, and learning disabilities, and their use of safer alternatives. The CFP Survey adds the “H” of human Health to Environmental, Social, and Governance (ESG) factors, thereby filling a critical missing gap in current tools to evaluate corporate sustainability.

Investors, retailers, health care organizations and NGOs are signatories to the Chemical Footprint Project, indicating their interest in having access to data on corporate chemicals management. Signatories to CFP include investors with over \$2.8 trillion in assets under management and purchasers from health care and retail with an estimated \$700 billion in purchasing power.

Launched in 2014, a diverse portfolio of companies participate in the annual CFP Survey. These companies vary by business sector, product type, firm size, and whether they are publicly traded or privately held. The

How to participate in the CFP Survey— from January 2 to March 31:

- Register at chemicalfootprint.org
- Complete the questions
- Provide documentation
- “Submit completed survey”

Learn more about CFP at www.chemicalfootprint.org

- Read the 2018 Annual Report
- Participate in webinars
- Participate in classes

Questions contact: moreinfo@chemicalfootprint.org

findings from the first three years of the Survey reveal companies developing more comprehensive chemicals management policies, knowing more about the chemicals in their products, measuring their chemical footprint, and revealing more of this data to the public.

Similar to carbon footprinting, chemical footprinting applies to any industry sector. Business sectors use chemicals by virtue of the materials and products they manufacture, purchase, and/or sell. Sectors currently active in the CFP Survey include apparel and footwear; building products, especially furniture and furnishings; consumer packaged goods; electronics; medical devices; retail; and toys. Companies can participate by registering and logging onto www.chemicalfootprint.org to access the Survey. Responders have the option of choosing whether to publicly share their participation, responses, and scores related to the Survey.

The CFP Survey provides an unbiased evaluation of chemicals health and safety management using a publicly transparent question and response survey. Clean Production Action developed the Survey and scoring rubric with business leaders, other NGOs, and our co-founders at the University of Massachusetts Lowell Center for Sustainable Production and the consultancy Pure Strategies. Using a zero to 100 point scale, the Survey distills the complexity of chemicals management into four pillars: Management Strategy, Chemical Inventory, Footprint Measurement, and Public-Disclosure & Verification. Companies voluntarily participate in the Survey, providing answers to the Survey questions, which we then evaluate and score.

This is the guidance document for the CFP Survey questions and response options contained in the online Survey. Use it to understand the questions and response options, and to learn examples of practices that align with the response options.

The four pillars of the CFP Survey are:

Management Strategy: measures the scope of corporate chemical policies and their integration into business strategy, accountability and incentives for safer chemical use, as well as support of initiatives and public policies for safer chemicals.

Chemical Inventory: measures a company's level of knowledge about the chemicals in its products, components, and manufacturing processes; and its systems for managing chemical data and ensuring supplier compliance with its reporting requirements.

Footprint Measurement: measures whether a company sets goals to reduce chemicals of high concern, whether the firm has established a baseline corporate chemical footprint and measured progress in reducing chemicals of high concern, and whether safer alternatives are assessed, identified and used.

Public Disclosure and Verification: measures whether a company publicly releases information on the chemicals in its products and used in its manufacturing, whether it discloses its answers to the Survey questions and score, and whether its answers have been independently verified by a third party.

Participation Options

The CFP Survey is flexible in terms of allowing initial steps and moving to more comprehensive and public steps. Responders can:

- Be completely anonymous or public (share responses and scores), or somewhere in between
- Complete the Survey for a few product lines or the entire organization: start small and expand scope over time
- Answer a few questions or all 19 questions

This guidance document describes the intent of each question. Additionally, when needed, there is a further explanation of what is being evaluated and relevant examples. The CFP Survey is 19 questions scored on a scale of 0 to 100, with 100 representing best performance.

Six pre-questions appear at the beginning of the online Survey. These questions do not impact scores and are held confidential. If a company chooses to disclose its Survey responses in question D2, note that this disclosure does not include responses to the pre-questions.

Steps to completing the Survey:

- Educate yourself about the Survey by participating in a webinar and reading this guidance document. Recorded webinars are available at www.chemicalfootprint.org.
- Go to www.chemicalfootprint.org to apply to complete the online Survey. The online tool is available to businesses that plan to fully complete the questions and receive a score on their overall performance.
- Go online, answer the questions, and be sure to provide supporting documentation. Click "Submit completed survey" after answering all 19 questions.

Data from responders are collated and analyzed in an annual report that highlights leaders and identifies best practices and opportunities for improvement.

The CFP Survey questions and response options align with other sustainability frameworks, including the United Nations Sustainable Development Goals (SDGs), the Sustainability Accounting Standards Board (SASB), and criteria used by EPEAT—a global eco-label for the

technology sector. The relevance of these standards to specific questions and response options are highlighted throughout the Guidance Document. For details on the alignment of the CFP Survey to the SDGs, SASB, and EPEAT see Appendix E.

We look forward to your participation in the CFP Survey. For answers to any of your questions please contact us at: moreinfo@chemicalfootprint.org.

The CFP Survey Questions

This guidance document is organized according to the pre-questions and the four pillars of the Survey: Management Strategy, Chemical Inventory, Footprint Measurement, and Public Disclosure and Verification. Listed below are the six pre-questions and 19 Survey questions, followed by five sections that detail each question and its related response options.

PRE-QUESTIONS (4 points)

Pre-question 1

How large is your company?

Pre-question 2

Indicate the scope of your product portfolio for which you are reporting.

Pre-question 3

Within the scope for which you are reporting, what type(s) of products does your company produce or sell?

Pre-question 4

Within the scope for which you are reporting, what is your six digit GICS code?

Pre-question 5

Does your company agree to disclose its participation in the CFP Survey?

Pre-question 6

Indicate your reporting year.

MANAGEMENT STRATEGY (20 points)

M1. Does your company have a chemicals policy that aims to avoid chemicals of high concern (CoHCs) and includes a stated preference for the use of safer alternatives? (8 points)

M2. Is reducing the use of CoHCs and advancing safer alternatives beyond regulatory requirements integrated into your company's business strategy? (4 points)

M3. How does your company advocate externally for the use of safer chemicals? (4 points)

M4. What means of accountability does your company have in place to ensure implementation of your chemicals policy? (4 points)

CHEMICAL INVENTORY (30 points)

- I1. What is the scope of chemicals of concern you restrict in your products and manufacturing processes? (5 points)
- I2. What actions does your company take to ensure that its requirements are current and implemented effectively? (5 points)
- I3. What chemical information does your company, either directly or through a respected third party, collect from suppliers? (5 points)
- I4. For what percentage of products sold by your company do you collect full chemical ingredient information? (5 points)
- I5. What capabilities does your company have for managing data on chemical ingredients in its products? (5 points)
- I6. How does your company ensure compliance with your chemicals requirements? (5 points)

FOOTPRINT MEASUREMENT (30 points)

- F1. Has your company set goals for reducing CoHCs in the products you sell and measured progress toward these goals? (5 points)
- F2. How does your company measure its baseline chemical footprint? (8 points)
- F3. Over the most recent year for which you have data, how much have intentionally added CoHCs in your products changed? (8 points)
- F4. How does your company assess the hazards of chemicals in its products and for what percent of products has your company assessed these hazards? (3 points)
- F5. How does your company encourage the use of safer alternatives to CoHCs? (6 points)

PUBLIC DISCLOSURE AND VERIFICATION

(20 points)

- D1. What information does your company disclose about the chemical ingredients in its products? (8 points)
- D2. Does your company agree to publicly disclose its responses to the CFP Survey? (3 points)
- D3. Does your company agree to publicly disclose its score on the CFP website? (5 points)
- D4. Have any of your company's responses to the Survey questions been verified by an independent third party? (4 points)

Key Terms and Definitions

A full glossary is provided in Appendix C.

Chemical Footprint

The total mass of chemicals of high concern (CoHCs) in products sold by a company, used in its manufacturing operations, facilities, by its suppliers, or contained in packaging.

For 2018, CFP addresses a more limited scope and asks participating companies to calculate either the total mass or count of chemicals of high concern (CoHCs) in their products. Companies are also given the option to calculate their chemical footprint based on a relatively short list of chemicals, the European Union's Candidate List of Substances of Very High Concern for Authorization (EU Candidate SVHC List). We are not asking companies to determine CoHCs used in their manufacturing operations, their facilities, by their suppliers, or contained in packaging, though this information may be requested in the future.

For more details on how to calculate a chemical footprint, see page 30.

Full Chemical Ingredient Information—

For formulated products—A company knows:

- 100% of the intentionally added substances by mass and
- Any likely impurities that are both a CoHC and present at 100 parts per million (ppm) or higher in the formulation.

For articles—A company knows:

- 95% of the intentionally added substances by mass and
- Any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.

Chemical of High Concern (CoHC)

A chemical that meets any of the following criteria:

- Carcinogenic, mutagenic, or toxic to reproduction (CMR);
- Persistent, bioaccumulative and toxic substance (PBT);
- Any other chemical for which there is scientific evidence of probable serious effects to human health or the environment that give rise to an equivalent level of concern (for example, an endocrine disruptor or neurotoxicant); or
- A chemical whose breakdown products result in a CoHC that meets any of the above criteria.

Using this definition, the Chemical Footprint Project compiled the CFP CoHC 2018 List from 14 lists of hazardous chemicals developed by governments and other authoritative bodies. The CFP CoHC 2018 List includes any chemical or chemical group that meets any combination of the CFP criteria for a CoHC on any of the 14 lists. Substances on these lists that could not plausibly be an intentionally added ingredient of a product were excluded (e.g., viruses, alcoholic beverages). The source lists and links to their websites can be found in Appendix D.

While each source list is dynamic, to simplify reporting the CFP CoHC 2018 List is static. The 2018 List reflects chemicals and chemical groups on the source lists that meet the criteria for a chemical of high concern as of October 31, 2018.

The CFP CoHC 2018 List aligns with the approach used by GreenScreen® for Safer Chemicals to identify CoHCs, known as “[List Translator-1](#)” chemicals (LT-1s).

Restricted Substances List (RSL)

A list of chemicals restricted by a company in products, parts, or components from its suppliers.

Safer Alternative

A chemical that due to its inherent chemical and physical properties exhibits a lower propensity to persist in the environment, accumulate in organisms, and induce adverse effects in humans or animals than chemicals in current use. In addition, the alternative must deliver the needed functional performance. A safer alternative may eliminate the need for the chemical through material change, product re-design, or product replacement; or by altering the functional demands for the product through changes in consumer demand, workplace organization, or product use.

Pre-Questions

Responses to the pre-questions do not impact scores and will be held confidential by the Chemical Footprint Project. If you choose in question D2 to make your CFP Survey responses public, note that pre-question responses will not be included in this disclosure.

The pre-questions must be answered before you may proceed to the CFP Survey. Please be careful when answering the pre-questions, as you will not be able to return to them. If you find you have made a mistake in your pre-question responses, please contact moreinfo@chemicalfootprint.org for assistance in correcting it.

PRE-QUESTION 1

What size is your company?

- a. If your company is publicly traded, provide FY 2017 revenue: _____
- b. If your company is privately held, check one of the following:
 - i. FY 2017 revenue greater than \$50 billion
 - ii. FY 2017 revenue greater than \$5 billion and less than or equal to \$50 billion
 - iii. FY 2017 revenue greater than \$0.5 billion and less than or equal to \$5 billion
 - iv. FY 2017 revenue less than or equal to \$0.5 billion

PRE-QUESTION 2

Indicate the scope of your product portfolio for which you are reporting:

Choose one:

- a. All product lines
- b. Select product lines or divisions.
 - i. Indicate which product lines or divisions:

 - ii. What value of product portfolio by sales does this scope represent?
 - FY 2017 revenue greater than \$50 billion
 - FY 2017 revenue greater than \$5 billion and less than or equal to \$50 billion
 - FY 2017 revenue greater than \$0.5 billion and less than or equal to \$5 billion
 - FY 2017 revenue less than or equal to \$0.5 billion

Explanation:

The Chemical Footprint Project Survey is intended to provide a corporate-wide measure of chemicals management. However, as an initial step, some responders choose to report on a subset of their company's products.

PRE-QUESTION 3

Within the scope for which you are reporting, what type(s) of products does your company produce or sell?

Check one:

- a. Formulated products
- b. Articles
- c. Both formulated products and articles

Explanation:

A “formulated product” is a preparation or mixture of chemical substances that can be gaseous, liquid, or solid (e.g., paints, liquid cleaning products, adhesives, coatings, cosmetics, detergents, dyes, inks, lubricants). A formulated product can be an intermediate product sold to another formulator, fabricator, or distributor or a final product sold to a consumer or retailer.

An “article” is an object which during production is given a special shape, surface or design which determines its function to a greater degree than its chemical composition.

PRE-QUESTION 4

Within the scope for which you are reporting, what is your six digit GICS code?

Explanation:

Please choose as many GICS codes as apply for the scope of your product portfolio for which you are reporting.

PRE-QUESTION 5

Does your company agree to disclose its participation in the CFP Survey?

Check one:

- a. DO NOT list my company as a participant in the CFP Survey.
- b. LIST my company as a participant in the CFP Survey.

Explanation:

Your company name will be listed as a responder on the CFP website and the annual report unless you decline this option. For an example of how companies are listed, click here: <https://www.chemicalfootprint.org/results/companies>. By choosing “list,” your company’s name will be listed as a responder in the 2019 CFP Annual Report, on the CFP website, and in related presentations. By choosing “do not list,” your participation will remain confidential. The options to make your CFP responses and score public are provided in questions D2 and D3, respectively.

PRE-QUESTION 6

Indicate your reporting year: mm/yyyy–mm/yyyy

Management Strategy (M) (20 POINTS)

M1. Does your company have a chemicals policy that aims to avoid chemicals of high concern (CoHCs) and includes a stated preference for the use of safer alternatives? (8 points)

Response Options

Check all that apply.

- a. Our company has a policy that addresses the following:

Scope	Reduce CoHCs	Preference for Safer Alternatives	Publicly Available
Products			
Manufacturing			
Facilities			
Supply Chain			
Packaging			

- b. Our company does not have manufacturing operations.
c. Our company has no established policy at this time.

Intent

This question seeks to understand the scope of your company's chemicals policy concerning CoHCs, including products, manufacturing, supply chains, facilities and packaging, whether the policy includes a preference for safer alternatives, and whether it is publicly available.

Explanation

A chemicals policy encompasses how a company manages chemicals in its materials, products, supply chains, manufacturing operations and facilities, beyond what is required by regulation. Some organizations use terms such as "materials policy" or "chemicals guidance" for statements that are equivalent to a chemicals policy. A chemicals policy is distinct from a company's overall sustainability policy in that it provides specific guidance related to chemicals management. A chemicals policy may focus on only products sold or it may encompass some or all elements that are relevant to a product life cycle, including: facility operations, manufacturing processes, supply chain, and packaging.

To earn points for this question, your company's policy must go beyond regulatory compliance and specify actions on chemicals of concern beyond those that are restricted or prohibited by law. This could mean including an emerging set of chemicals of special concern, chemicals likely to be regulated, or classes of chemicals of concern to your customers. For example, a chemicals policy may specify that chemicals that are allergens, aquatic toxicants, or respiratory sensitizers are to be avoided. Some far-reaching policies aspire to eliminate all chemicals of concern. A chemicals policy may also encourage transparency of chemical ingredient information throughout the value chain to enable informed decision making. In addition, a chemicals policy may identify the process by which a company assesses alternatives to chemicals it seeks to reduce or eliminate.

CFP encourages respondents to create a comprehensive chemicals policy. Therefore, policies that encompass elements beyond the product level (facilities, manufacturing, supply chain, and/or packaging), with an explicit

Management Strategy (M) (CONTINUED)

preference for safer alternatives, and that are publicly available receive additional points.

CFP defines chemicals in facilities as: chemicals in products (excluding those used directly in manufacturing), used in offices, retail space, laboratories, distribution centers, outdoor space. This includes, e.g., cleaning products, landscaping products, furniture, building products, etc.

Preference for safer alternatives

Without embedding a preference for safer alternatives to hazardous chemicals, companies may successfully eliminate a chemical of concern, only to replace it with another chemical of equal or greater concern. To receive credit, your company's chemicals policy must explicitly state a preference for safer alternatives or for an approach that reduces or eliminates the use and generation of hazardous substances.

CFP defines a safer alternative as: a chemical that, due to its inherent chemical and physical properties, exhibits a lower propensity to persist in the environment, accumulate in organisms and induce adverse effects in humans or animals, and delivers the functional performance required. A safer alternative can also include eliminating the need for the chemical through material change, product re-design, or product replacement; or eliminating the chemical by altering the functional demands for the product through changes in consumer demand, workplace organization, or product use.

Publicly available policy

CFP encourages respondents to make their chemicals policies publicly available. To receive credit for this option, provide the web link for your policy(ies). If you select "yes" in D2, the link to your chemicals policy will be included as part of your responses.

Manufacturing

If your company does not manufacture products, please select option b.

Supply chain

A chemicals policy that applies to a company's supply chain should cover, at minimum, Tier 1 suppliers.

Response Example

The fictional Acme Brand has a chemicals policy that applies to its products and packaging that explicitly states a commitment to reduce CoHCS, a preference for safer alternatives, and is posted on the Acme website. It has a second, internal policy that applies to its Tier 1 suppliers that states a commitment to phase out CoHCS with a preference for safer alternatives. Acme does not operate its own manufacturing facilities and does not have a policy that covers chemicals in its facilities. Acme would respond to M1 as follows:

- a. Our company has a policy that addresses the following:

Scope	Reduce CoHCS	Preference for Safer Alternatives	Publicly Available
Products	X	X	Web Link
Manufacturing			
Facilities			
Supply Chain	X	X	
Packaging	X	X	Web Link

- b. ___ x ___ Our company does not have manufacturing operations.
- c. _____ Our company has no established policy at this time.

Chemical Policy Examples

The BizNGO Chemicals Work Group has developed the BizNGO Model Chemicals Policy for Brands and Manufacturers (<https://www.bizngo.org/safer-chemicals/corporate-policies>), which includes both a policy template and examples of how companies are addressing different aspects. Please note that question M1 does not require that all six sections of the BizNGO Model Chemicals Policy be included in a single document to qualify as a corporate chemicals policy. Corporate chemicals policies should include, at a minimum, the first two sections of the Model Chemicals Policy: Statement of Intent and Scope.

The Environmental Defense Fund has developed the EDF Model Chemicals Policy for Retailers of Formulated Products (<http://business.edf.org/projects/model-chemicals-policy>), which served as the basis for developing the BizNGO Model Chemicals Policy for Brands and Manufacturers.

Alignment with other frameworks

EPEAT

1. Mobile Phones, UL 110: 7.3.1
2. Servers, NSF 426: 6.2.5, 6.2.6
3. PC&D Revision, IEEE 1680.1(2018): 4.1.8.1
4. PV, NSF 457: 5.1.5, 5.1.6

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Please provide a narrative summary of how your company's chemicals policy addresses each of the relevant response options. Provide a copy of and/or a link to your chemicals policy. If policies are embedded within a larger document, note the page number(s) you would like to be considered as relevant documentation.

File Upload

Please upload supporting documentation. Multiple documents should be combined into a single PDF. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Management Strategy (M) (CONTINUED)

M2. Is reducing the use of CoHCs and advancing safer alternatives beyond regulatory requirements integrated into your company's business strategy?

(4 points)

Renspose Options

Check all that apply.

- a. We screen for CoHCs in product design and/or procurement.
- b. We have a list of safer chemicals or safer materials that are preferred in product design and/or procurement.
- c. We avoid the use of CoHCs in our manufacturing processes.
- d. We do not manufacture products.
- e. Our company highlights the use of safer chemicals and materials in its product marketing.
- f. None of the above.

Intent

This question inquires about whether your company integrates into its business strategy an approach for addressing human health and environmental impacts of chemicals beyond regulatory requirements.

Explanation

Integration can occur as part of product design, the product development process, manufacturing process, marketing, etc. Integration is most effective when CoHCs are identified and a strategy for reduction and elimination of CoHCs and use of safer alternatives is developed that includes specified deadlines. It is important that suppliers and vendors are informed of these requirements. For option "e," specify how your organization integrates chemicals and materials in marketing material for customers; information should not appear only on the sustainability page or equivalent.

Example

Nike, Inc. has integrated the development of a "more sustainable palette of materials and chemistries" into its business strategy through product design, product development, and procurement. Nike acknowledges that its greatest impacts emerge from the production of the materials it uses in its products. Nike focuses

its business strategy on integrating its preference for greener chemistries into product design, where it has the greatest impact and opportunity for change. See [Nike's Sustainable Report for FY 2016/2017](#).

Alignment with Other Frameworks

EPEAT

1. Servers, NSF 426: 6.2.6
2. PV, NSF 457: 5.1.6

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Provide links to or copies of any relevant company documents. For option "e," provide marketing materials that includes either avoided materials or safer chemistries.

File Upload

Please upload supporting documentation. Multiple documents should be combined into a single PDF. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

M3. How does your company advocate externally for the use of safer chemicals?

(4 points)

Response Options

Check all that apply. Our company engages in external initiatives that clearly promote the:

- prioritization of chemicals for reduction based on their inherent hazards.
- reduction in the use of CoHCs.
- development and adoption of safer alternatives, including green chemistry solutions.
- public disclosure of CoHCs or other chemical ingredients in products.
- none of the above.

Intent

This question evaluates your company's engagement in external initiatives that promote collecting and publishing data on chemical hazards, prioritize chemicals for reduction based on their inherent hazard, reduce the use of CoHCs, develop and use safer alternatives, and disclose information on CoHCs in products.

Explanation

To receive credit for this question your company must be engaged in an external initiative that aligns with the "a-d" response options listed above. Note that because some programs encompass multiple response options, support for one external initiative could receive credit for multiple response options. For example, a company that publicly supports the California Safer Consumer Product Regulations or actively participates in the [Green Chemistry in Commerce Council](#) or [BizNGO](#) would receive credit for response options: "a," "b," "c," and possibly "d." A company that actively participates in [ZDHC](#) would receive credit for response options: "a," "b," and "c." Members of the [Health Product Declaration Collaborative](#) would receive credit for response option "d." Participation in the development of standards for eco-labels could receive credit for "a," "b," "c," and "d," depending on the standard. Staff presentations at conferences or on webinars on company initiatives relative to any of the response options would receive credit for the relevant response options. Specific examples by response option include:

- Prioritization of chemicals for reduction based on their inherent hazard. This includes supporting the development or implementation of initiatives and programs to identify and prioritize chemicals for reduced use based on their hazards. Generically this includes policies and programs that advance: pollution prevention, toxics use reduction, and cleaner production. For example, this would include supporting the implementation of the:
 - [California Safer Consumer Products Regulations](#),
 - [Massachusetts Toxics Use Reduction Act](#), and
 - [UNIDO-UNEP Cleaner Production Programs](#).
- Reduction in the use of CoHCs. This means supporting the development or implementation of initiatives that define a clear path to reducing the use of CoHCs in products, manufacturing, supply chains, or packaging. Generically this includes policies and programs that restrict the use of chemicals, including in products, manufacturing, agriculture, packaging, or as by-products from industrial processes. For example, this would include publicly supporting the development or implementation of chemical restrictions that align with:
 - Various state, provincial, city, and local restrictions, including those restrictions detailed in the Interstate Chemicals Clearinghouse—[State Chemicals Policy Database](#) and [Safer States](#) policy database.
 - [Sweden's initiative to restrict hazardous plasticizers](#) in everyday products,

Management Strategy (M) (CONTINUED)

- [Stockholm Convention on Persistent Organic Pollutants \(POPS\)](#), or
- [EU REACH Directive](#).

For an extensive list of policies that restrict chemicals, see the OECD Substitution and Alternatives Toolbox – [Regulations and Restrictions website](#).

- c. Development and use of safer alternatives. This means supporting the development or implementation of initiatives to use alternatives that are inherently less hazardous than the chemicals they replace. For example:
- Various state programs listed in the Interstate Chemicals Clearinghouse—[State Chemicals Policy Database](#) and [Safer States](#) policy database,
 - [US EPA Safer Choice program](#), or
 - [Sweden Keml—toxic-free everyday environment](#).
- d. Public disclosure of CoHCs or other chemical ingredients in products. This means supporting the development or implementation of public initiatives to disclose CoHCs or other chemical ingredients in products. For example, this would include supporting the development or implementation of California’s Cleaning Product Right to Know Act of 2017, as well as various state chemical ingredient disclosure policies listed in the Interstate Chemicals Clearinghouse’s [State Chemicals Policy Database](#) and [Safer States](#) policy database, or The [United Nations Environment Programme’s Chemicals in Products Project](#).

Note that you can check all that apply.

Examples

At the corporate level, [Seventh Generation’s “toxin free campaign”](#) is an example of a how company can support public policies that advance: “a,” “b,” “c,” and “d.” Specifically, Seventh Generation states that it advocates for legislation that: allows the US EPA “to take fast action on the worst chemicals” and protects “the most vulnerable among us” (“a” and “b”); and requires that the “federal government invest in developing safer alternatives to toxic chemicals” (“c”); and enables public “access to information regarding the safety of chemicals” (“d”).

Levi Strauss and Co. is an active member of the Joint Roadmap to Zero Discharge of Hazardous Chemicals, an apparel industry collaboration for the elimination of the discharge of hazardous chemicals by 2020, and shares its progress toward hazard assessment and reduction publicly on its website.

HP is an active member of Green America’s Clean Electronics Production Initiative, a multi-stakeholder initiative aimed at moving the electronics industry toward zero exposure to hazardous substances in the manufacturing process. HP also collaborates with industry partners through the International Electronics Manufacturing Initiative (iNEMI) to develop alternative materials, such as those used for low-halogen printed circuit boards, and to improve alternative materials assessment standards.

Supporting Documentation

Please provide a narrative summary of how your company’s activities support any of the options “a–e.” In addition, please provide supporting documentation. This may include: information on your website or in printed material about how your organization supports the development and use of safer chemicals, organizations of which your company is an active member, principles or programs onto which you have signed, testimony you have provided, etc.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

M4. What means of accountability does your company have in place to ensure implementation of your chemicals policy? (4 points)

Response Options

Check all that apply. Our company:

- a. delineates chemicals management responsibilities in job descriptions and individual annual performance metrics.
- b. assigns member(s) of senior management responsibility for meeting chemical policy goals and objectives.
- c. has financial incentives for senior management to meet corporate sustainability goals. These goals include reducing the use of some or all CoHCs.
- d. has board level engagement in the implementation of our chemicals policy.
- e. has none of the above

Intent

The purpose of this question is to evaluate whether the implementation of your chemicals policy is clearly delineated in the work responsibilities of your company's employees, senior management, and/or board members.

Explanation

Implementation of a chemicals policy includes setting objectives and targets, tracking and reporting on performance, assurance, and review and revision activities. To implement such changes, it is essential that employees are knowledgeable about their company's chemicals policy, engaged in its implementation, and rewarded for their participation in the change process. In addition, a systematic transition toward the use of safer chemicals and products requires support and accountability at high levels of an organization. When a member of the executive team of an organization is responsible for reducing the use of chemicals of high concern, he or she will engage other members of the company to help achieve this objective. Board level visibility to chemical policy

goals and progress toward those goals signals high level interest in implementation of a chemicals policy.

Note that you can check all response options that apply.

Example

Dignity Health's [Comprehensive Chemicals Policy](#) addresses response option "a" by integrating its chemicals policy implementation into the organization's "operations councils and hospital safety committees."

Supporting Documentation

Please provide a narrative summary for any checked item. Include the title and description of responsibilities for the highest ranking person in the company responsible for chemicals management.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Chemical Inventory (I) (30 POINTS)

1. What is the scope of chemicals of concern you restrict in your products and manufacturing processes? (5 points)

Response Options

Choose one of response options “a – d,” if applicable, option “e,” and/or option “f,” or choose “g.”

Our company:

- uses our RSL(s) to manage legal compliance within each market where it operates. Our RSL(s) include(s) only chemicals that are legally restricted in each market.
- uses a single RSL that reflects the strictest regulation in all of the countries or markets in which the brand operates and sells products (e.g., regulations that apply to manufacturing, marketing, and sales locations).
- uses a single RSL that reflects the strictest regulation in all locations worldwide.
- uses a single RSL that includes limits or bans of chemicals beyond what is covered in the most restrictive global regulations, or it includes chemicals that may not be subject to regulation but which the registrant has voluntarily chosen to limit or ban from its products.
- has developed an MRSL.
- uses a list of chemicals identified for reduction beyond regulatory requirements. Our company may or may not require suppliers to eliminate these chemicals in products, parts, or components.
- uses none of the above.

Intent

This question seeks to understand the scope of chemicals restricted in your products and manufacturing processes beyond legal requirements.

Explanation

CFP defines a restricted substances list (RSL) as a list of chemicals restricted by a company in products, parts, or components from its suppliers. An RSL may include only chemicals that are currently restricted by regulation. It may also include chemicals that are not yet legally restricted but have been identified as being of concern because of scientific evidence that they may cause harm to human health or the environment.

Option a: The scope of an RSL, at minimum, includes chemicals that are currently restricted or banned in finished products because of a regulation or law; that is, legally restricted substances. Because jurisdictions have different chemical restrictions, a company may maintain separate RSLs for each jurisdiction where it operates. Select option “a” if your RSL(s) do(es) not include

restrictions on chemicals that go beyond legal compliance for any jurisdiction where you operate. Requiring suppliers to assure that products or components do not contain chemicals on an RSL designed for legal compliance is a first and significant step in a transition to safer chemicals use.

Option b: A company may develop a single RSL that meets the most stringent legal restrictions for all jurisdictions where it operates. As a result, the RSL will likely include restrictions that are beyond legal compliance for some jurisdictions with less stringent regulations.

Option c: Some companies adopt an RSL for all substances legally restricted by any jurisdiction, even though they may not sell or operate in that jurisdiction.

Option d: A company may take additional actions to identify chemicals of concern in addition to those that are legally restricted. For example, a company may decide to identify and begin to restrict chemicals designated by the International Agency for Research on

Cancer (IARC) as known or probable human carcinogens, even if there are no current legal restrictions on those substances for its products. The types of hazard characteristics that are of concern—for example, endocrine disruption, skin sensitization, respiratory sensitization, or ecotoxicity—will vary depending on a product category.

Once a company has created an RSL that goes beyond compliance, it will want to evaluate its products against this list. A company may conduct research to better understand which of these chemicals are likely to be in its products and may also conduct product testing. A company may ask suppliers to report directly on whether these chemicals are contained in products or it may ask suppliers to report this information to a third party service provider as a way to protect confidential business information. Supplier reporting is addressed in question I3.

Option e: In addition to an RSL, which restricts chemicals of concern in products, parts, or components, a company may also develop a manufacturing restricted substances list (MRSL). An MRSL is a list of chemicals banned from intentional use in facilities that process materials, components and/or products. An MRSL establishes acceptable concentration limits for substances in chemical formulations used within manufacturing facilities.

Option f: Some companies do not restrict chemicals beyond regulatory requirements, but work with suppliers in other ways to identify and encourage the use of safer alternatives. This may include preferring suppliers that demonstrate the use of safer alternatives, working with suppliers to develop safer alternatives, or other approaches.

Choose one response option, “a – d” to describe your RSL and, if you have an MRSL, option “e,” or choose “f”.

Examples

Option a: RSLs designed to achieve only legal compliance typically relate to specific products and/or sectors, such as the European Union’s Restriction of Hazardous Chemicals (RoHS) Directive, which restricts chemicals used in electronics.

Option c: The *American Apparel & Footwear Association’s (AAFA) Restricted Substances List (RSL)* identifies chemicals that are restricted or banned in finished home textile, apparel, and footwear products anywhere in the world. In each case, the RSL identifies the most restrictive regulation. The AAFA updates its Restricted Substances List on a regular basis. This tool is useful for assuring environmental compliance with global regulations and may also be used to call attention to substances that may be of concern in this industry sector but are not yet widely regulated.

Option d: A company may expand its RSL beyond legally restricted chemicals in several ways. It may review lists that have been created by NGOs, such as ChemSec, which has developed the *SIN List*. The chemicals on the SIN List have been identified by ChemSec as Substances of Very High Concern based on the criteria established by the EU REACH chemicals regulation. Another example is the *“Hazardous 100+ List”* developed by the US NGO Safer Chemicals, Healthy Families. Some companies may review the State of California’s *Proposition 65 List* of chemicals to identify additional chemicals of concern. Companies may also review “green” product standards such as those identified by *ecolabelling organizations* to identify chemicals that are restricted in these products. If resources allow, a company may employ a toxicologist to keep abreast of the latest scientific literature on chemicals of concern in consumer products. A company may also engage stakeholders such as its business customers and environmental health NGOs in developing its RSL. It is important that an RSL be updated on an annual basis at minimum, as new scientific evidence may reveal additional chemicals of concern.

Benetton Group’s RSL includes both legally restricted and chemicals that are of concern, but not legally restricted.

The cosmetics company, Beautycounter, has an extensive Restricted Substances List that it calls *“The Never List.”*

Chemical Inventory (I) (CONTINUED)

Option e: The *ZDHC MRSL V1.1* is a list of chemical substances banned from intentional use in facilities that process textile materials and trim parts in apparel and footwear. The MRSL establishes acceptable concentration limits for substances in chemical formulations used within manufacturing facilities.

Option f: *Walmart* has identified a list of high priority and priority chemicals. It has set a goal to reduce its chemical footprint for consumables based on this list by 10 percent by 2022. Toward that goal, Walmart asks its suppliers of formulated consumable products to provide full online ingredient disclosure by product; to disclose, at minimum, Walmart Priority Chemicals on packaging beginning in 2018; to disclose full product formulations to The Wercks; to complete the Sustainability Index to track performance on chemical disclosure, risk assessment and hazard avoidance; to reduce, restrict and eliminate use of high priority and priority chemicals; and to verify purity of ingredients where contaminants of concern may exist, starting in 2019.

Alignment with other frameworks

Sustainability Accounting Standards Board:

1. Standard: Apparel, Accessories & Footwear (draft)
Topic: Management of Chemicals in Products
Metric: Description of processes to maintain compliance with restricted substances regulations
2. Standard: Building Products & Furnishings (draft)
Topic: Management of Chemicals in Products
Metric: Percentage of applicable products meeting volatile organic compound (VOC) emissions and content standards

EPEAT

1. Servers, NSF 426: 6.2.5
2. PV, NSF 457: 5.1.5

For further details on alignment with other sustainability frameworks, see Appendix E.

Supporting Documentation

Please provide a copy and/or a link to your RSL and, if available, MRSL or other applicable list.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

I2. What actions does your company take to ensure that its requirements (as selected in I1) are current and implemented effectively? (5 points)

Response Options

Check all that apply. Our company:

- delineates compliance requirements in contracts with suppliers.
- trains suppliers about how to comply with our requirements.
- updates our RSL/MRSL/other requirements at minimum on an annual basis.
- engages external stakeholders such as non-governmental organizations (NGOs), business customers, and consumers in the development of our RSL/MRSL/other requirements.
- publicly discloses our RSL/MRSL/other requirements.

Provide web link: _____ .

- uses none of the above.

Intent

This question seeks to understand the measures your company takes to regularly update and effectively implement restrictions beyond compliance for hazardous chemicals. Note that if your company maintains an RSL that does not go beyond compliance (indicated by selecting response option I1a), you will not receive points for this question.

Explanation

To ensure compliance with this list it is essential that suppliers understand its requirements and are trained in how to comply. In addition, it is important that this list be updated on an annual basis, at a minimum, as new scientific evidence may result in additional chemicals of concern being legally restricted.

Examples

Leading brands in the apparel and footwear industry that participate in the Apparel & Footwear International RSL Management Group (AFIRM) have published an [RSL Supplier Implementation Toolkit](#) to assist suppliers in complying with the RSL.

Leading brands in the building products sector participate on advisory boards of initiatives such as the [HPD](#)

[Collaborative](#), [Cradle to Cradle](#), the [Healthier Hospitals Initiative](#) and [BIFMA](#) to help create and update lists of CoHCs beyond regulatory requirements.

Alignment with Other Frameworks

Sustainability Accounting Standards Board:
Standard: Apparel, Accessories & Footwear (draft)

- Topic: Management of Chemicals in Products
- Metric: Description of processes to maintain compliance with restricted substances regulations

For further details on alignment with other sustainability frameworks, see Appendix E.

Supporting Documentation

Please describe how your suppliers are trained about the use of this list. Provide supporting documentation to verify that requirements are specified in your contracts.

To receive credit for option “e,” you must provide a relevant hyperlink. If you select “yes” to question D2, this link will be included in your responses made public.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Chemical Inventory (I) (CONTINUED)

13. What chemical information does your company, either directly or through a respected third party, collect from suppliers? (5 points)

Response Options

In answering this question, choose one response option, “a – f”. Our company:

- a. requires suppliers to confirm that they comply with our RSL.
- b. requires suppliers to confirm that they comply with our RSL and to provide information on chemicals on our Watch List, which includes 1–50 chemicals.
- c. requires suppliers to confirm that they comply with our RSL and to provide information on chemicals on our Watch List, which includes more than 50 chemicals.
- d. requests that suppliers to provide full chemical ingredient information.
- e. requires suppliers to provide full chemical ingredient information.
- f. does none of the above.

Intent

This question seeks to understand the scope of information collected from your suppliers on chemicals in products, parts, and components.

Explanation

Requirements for sharing chemical information should be specified in contract agreements. The first step in this process will be to receive assurance from suppliers that chemicals listed on an RSL are not in the products they provide. A company may ask suppliers to report directly on whether these chemicals are contained in products or it may utilize a third party service provider to collect this information as a way to protect confidential business information.

Beyond compliance with an RSL, companies may ask about the presence of chemicals on a Watch List. CFP defines a Watch List as a list of chemicals of concern that your company does not currently prohibit, but is considering prohibiting in the future due to scientific evidence that a chemical may cause harm to human health or the environment. Sources for developing a Watch List are similar to those for developing an RSL beyond regulatory compliance, as described in I1.

A company may review lists that have been created by NGOs, such as ChemSec, which has developed the [SIN List](#). The chemicals on the SIN List have been identified by ChemSec as Substances of Very High Concern based on the criteria established by the EU REACH chemicals regulation. Another example is the [“Hazardous 100+ List”](#) developed by the US NGO Safer Chemicals, Healthy Families. Some companies may review the State of California’s [Proposition 65 List](#) of chemicals to identify additional chemicals of concern. Companies may also review “green” product standards such as those identified by [ecolabelling organizations](#) to identify chemicals that are restricted in these products. If resources allow, a company may employ a toxicologist to keep abreast of the latest scientific literature on chemicals of concern in consumer products. A company may also engage stakeholders such as its business customers and environmental health NGOs in developing its Watch List. It is important that an Watch List be updated on an annual basis at minimum, as new scientific evidence may reveal additional chemicals of concern.

Companies may ask their suppliers to provide complete information about the chemical ingredients in their products. Some companies refer to this as “full materials disclosure” or full materials declaration.” When full materials disclosure is required, suppliers will often utilize a third party service provider to protect their confidential business information. For CFP, the phrase full chemical ingredient information is synonymous with full materials disclosure. CFP defines full chemical ingredient information for formulated products and articles as follows:

- **For formulated products:** a company knows 100% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 100 ppm or higher in the formulation.
- **For articles:** a company knows 95% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.

Note that you can check all that apply.

Alignment with other frameworks

EPEAT

1. Imaging Equipment, IEEE 1680.2: 4.1.8.1
2. Televisions, IEEE 1680.3: 4.1.9.1
3. Mobile Phones, UL 110: 7.4.1, 7.4.2
4. Servers, NSF 426: 6.2.1, 6.2.2, 6.2.3, 6.2.4
5. PC&D Revision, IEEE 1680.1 (2018): 4.1.9.1, 4.1.9.2, 4.1.9.3

Supporting Documentation

Please provide documentation that supports your answer to this question.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Chemical Inventory (I) (CONTINUED)

14. For what percentage of products sold by your company do you collect full chemical ingredient information? (5 points)

Response Options

Answer all that apply.

14a. *formulated products*: For what percentage of formulated products sold by your company is full chemical ingredient information collected? _____ percent

14b. *articles*: For what percentage of articles sold by your company is full chemical ingredient information collected? _____ percent

Intent

This question seeks to understand the scope of your company's data collection on full chemical ingredient information. It is available only if, in question I3, you have checked response options "d" or "e."

Explanation

Please report using either mass or sales as a measurement unit. You may also report using product categories, but this measurement unit is less preferred.

Note that it is important to use the CFP's definitions of full chemical ingredient information for formulated products and articles:

- **For formulated products:** a company knows 100% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 100 ppm or higher in the formulation.
- **For articles:** a company knows 95% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.

Alignment with other frameworks

EPEAT

1. Mobile Phones, UL 110: 7.4.1, 7.4.2
2. Servers, NSF 426: 6.2.1, 6.2.2, 6.2.3, 6.2.4
3. PC&D Revision, IEEE 1680.1 (2018): 4.1.9.1, 4.1.9.2, 4.1.9.3
4. PV, NSF 457: 5.1.1, 5.1.2, 5.1.3, 5.1.4

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Please provide documentation that supports your answer to this question.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

15. What capabilities does your company have for managing data on chemical ingredients in its products? (5 points)

Response Options

Check all that apply. Our company has:

- a. an internal named point(s) of contact or outside contractor who communicates with suppliers concerning our chemical information requirements.
- b. a data system (either internal or third party) to manage an inventory of chemicals in products.
- c. a data system (either internal or third party) that links our inventory of chemicals in products to chemical hazard information.
- d. a data system for generating reports on chemical/material ingredient declarations to customers
- e. none of the above.

Intent

This question asks about your company's capabilities for interacting with tier one suppliers and managing chemical ingredient data, and your communications with your customers (either business-to-business or business-to-consumer) about these data.

Explanation

Implementing a data management system is an important next step after determining what chemicals may be of concern in your company's products and requesting data from suppliers on these substances. Identifying a point of contact for chemical hazard communication requirements will facilitate the reporting process. While these systems can be managed internally, some companies prefer to use a third party service provider to collect and manage chemical ingredient data to protect suppliers confidential business information. These electronic management systems can generate reports that are tailored to specific customer requests. Note that you can check all that apply.

Example

Seagate Technology PLC uses a third party to work with suppliers in collecting chemical/material ingredient information, and has developed its own internal data management system to collect ingredient information

and provide reports to its business customers on material ingredient disclosures. For I5, Seagate's data collection system meets the requirements of response options "a," "b," and "d."

A template for response option "c" is the [Health Product Declaration](#) form.

Alignment with other frameworks

EPEAT

1. Mobile Phones, UL 110: 7.4.1, 7.4.2
2. Servers, NSF 426: 6.2.1, 6.2.2, 6.2.3, 6.2.4
3. PC&D Revision, IEEE 1680.1 (2018): 4.1.9.1, 4.1.9.2, 4.1.9.3
4. PV, NSF 457: 5.1.1, 5.1.2, 5.1.3, 5.1.4

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Please provide a narrative description of your company's system to manage chemicals data.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Chemical Inventory (I) (CONTINUED)

16. How does your company ensure conformance with your chemicals requirements? (5 points)

Response Options

Check all that apply. Our company:

- has an audit program to verify supplier submitted data.
- requires suppliers to test parts in third party approved labs and provide results.
- trains suppliers on how to comply with reporting requirements.
- routinely tests parts, components, or products to ensure conformance with reporting requirements.
- has none of the above.

Intent

This question inquires about the measures your company takes to ensure that suppliers are accurately reporting on their claims regarding chemicals in products, especially CoHCs. It seeks to understand the level of certainty that your company achieves to verify supplier compliance with your chemical information requirements.

Explanation

A first step many companies take is to review the reporting forms submitted by suppliers. Many companies also require their suppliers to test parts in an approved laboratory and provide these results. Some companies offer training programs to their suppliers to help ensure compliance with reporting. Many companies also conduct their own routine testing of parts, components and products or contract with a third party to do so. Companies may also compare submissions by different suppliers to identify discrepancies.

If your company avoids all CoHCs in its products and as impurities, please describe how you ensure that these chemicals are not in the products you sell. You must include supporting documentation to receive points for this question.

Note that you can check all that apply.

Example

As part of its Restricted Substances List program and through the Zero Discharge of Hazardous Chemicals initiative *Levi Strauss & Co.* is likely to meet the following response options:

- Response option “a” by auditing its suppliers,
- Response option “b” by requiring suppliers test products at LS&Co. approved laboratories,
- Response option “c” by training its suppliers, and
- Response option “d” by routinely testing its own products.

Alignment with other frameworks

- Imaging Equipment, IEEE 1680.2: 4.1.1.1, 4.1.2.1, 4.1.3.2, 4.1.4.1, 4.1.5.1, 4.1.5.2, 4.1.6.1, 4.1.6.2, 4.1.6.3, 4.1.8.1, 4.8.1.1
- Televisions, IEEE 1680.3: 4.1.1.1, 4.1.2.1, 4.1.3.2, 4.1.4.1, 4.1.5.1, 4.1.6.1, 4.1.7.1, 4.1.7.2, 4.1.7.3, 4.1.8.1, 4.1.9.1, 4.8.1.1
- Mobile Phones, UL 110: 7.2.1, 9.1.1, 9.2.2, 9.2.3, 9.2.5
- Servers, NSF 426: 6.1.1, 6.1.3, 6.1.4, 6.1.6, 6.2.1, 8.1.1

5. PC&D Revision, 1680.1 (2018): 4.1.1.1, 4.1.2.1, 4.1.4.1, 4.1.5.1, 4.1.5.2, 4.1.6.1, 4.1.6.2, 4.1.7.1, 4.1.9.1, 4.7.1.1

6. PV, NSF 457: 5.2.2, 5.2.3, 5.2.4, 10.1.1

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Please provide a narrative summary of how your company assures conformance with its reporting requirements.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Footprint Measurement (F) (30 POINTS)

F1. Has your company set goals for reducing CoHCs in the products you sell and measured progress toward these goals? (5 points)

Response Options

Check all that apply in “a – d” or answer only “e” or “f.” Our company:

- a. has set goal(s) for reducing CoHCs by count or mass.
- b. publicly discloses the goal(s).
- c. publicly discloses specific CoHC(s) included in the goal(s).
- d. publicly reports annually on progress towards meeting goals. OR
- e. has no CoHCs in our products and publicly discloses this information. OR
- f. has none of the above.

For options “b,” “c,” “d,” and/or “e,” provide web link(s): _____

Intent

This question inquires about the specific goals that your company has set for reducing CoHCs in products you sell and the extent to which your company publicly discloses these goals.

Explanation

Having a formal process for setting goals and measuring and reporting on progress toward these goals provides accountability to your company’s stakeholders and shareholders. Ideally, a regular process for reviewing goals and progress occurs at least annually and is part of the reporting of key performance indicators.

In addition to setting these goals, publicly sharing these goals, and reporting on progress towards meeting them is an additional means of ensuring accountability. Supporting documentation for this question should identify the chemicals for which you have set a goal to reduce or eliminate and your reduction goals. For “a,” “b,” “c,” and “d,” check all that apply. **If your company does not use CoHCs, as defined by the CFP CoHC 2018 List, in its products and publicly discloses this information, select “e” and provide supporting documentation to receive full credit for this question.**

Examples

[GOJO](#), manufacturer of Purell Advanced Hand Sanitizer, set a goal in 2015 to reduce its chemical footprint by 50 percent by 2020.

Levi Strauss and Co. (LS&Co) as part of its Commitment to Zero Discharge of Hazardous Chemicals has set a goal of eliminating the discharge of hazardous chemicals by 2020 (note “zero discharge” is defined to include both chemicals in products as well as in manufacturing). LS&Co issues [progress reports](#) on meeting its goal, especially for specific chemical compounds.

By 2022, [Walmart](#) aims to reduce its consumables chemical footprint for Walmart U.S. and Sam’s Club U.S. stores by 10 percent.

Alignment with other frameworks

UN Sustainable Development Goals: SDG Indicators 3.9, 6.3, 12.4

EPEAT

1. Mobile Phones, UL 110: 7.3.1
2. Servers, NSF 426: 6.2.5, 6.2.6
3. PC&D Revision, IEEE 1680.1 (2018): 4.1.8.1
4. PV, NSF 457: 5.1.5, 5.1.6

For further details on alignment with other sustainability frameworks, see Appendix E.

Supporting Documentation

Please describe your goals and provide examples of public disclosure of goals including goals for reducing specific chemicals of high concern, and annual progress reports. If you checked “e” please include documentation to support this statement. To receive credit for options “b,” “c,” “d,” and/or “e,” provide relevant links. If you

choose “yes” in question D2, these links will be included in your publicly available response options.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Footprint Measurement (F) (CONTINUED)

F2 How does your company measure its baseline chemical footprint recent year for which you have data? (8 points)

Choose either response option “a,” options “a” and “b” or option “c” or option “d”. Our company:

- had intentionally added CoHCs/SVHCs in its products = ____ CoHCs/SVHCs by count and/or
- had intentionally added CoHCs in its products = ____ CoHCs/SVHCs by mass (kg), or
- had no intentionally added CoHCs in its products or
- is unable to answer this question at this time.

____ Enter the count of intentionally added CoHCs/SVHCs

____ Enter the mass (kg) of intentionally added CoHCs

Please indicate which reference list you are using:

____ CFP CoHC 2018 List

____ EU Candidate SVHC List

Intent

This question inquires about your company’s total use of CoHCs sold in products, either by count or by mass. To calculate your company’s chemical footprint you will need to have a system in place to collect and evaluate chemicals data that you (or a third party) receive from your suppliers. If you ask your suppliers to provide information on all intentionally added chemicals, you will be able to identify the chemicals of high concern in your products by count and/or mass.

Explanation

The CFP defines chemical footprint as the total mass of CoHCs in products sold by a company, used in its manufacturing operations its facilities, and by its suppliers, and contained in packaging.

For 2018, we are offering several options for calculating a chemical footprint with maximum point values that increase with the complexity and completeness of the calculation. Responders may choose from the following options:

- **Reference list:** Companies may choose to measure their chemical footprint against the CFP CoHC 2018 List (roughly 2,200 chemicals and chemical groups) or a shorter subset, the European Union’s Candidate Substances of Very High Concern (SVHCs).

The full reference list for calculating chemical footprint by count (option a) and mass (option b) or for determining that your company’s products do not contain CoHCs (option d) is the CFP CoHC 2018 List, which includes roughly 2,200 chemicals and chemical groups.

Alternately, your company may choose to calculate its chemical footprint by count (option a) and mass (option b) by referencing a subset of the CFP CoHC 2018 List, specifically the European Union’s List Candidate Substances of Very High Concern for Authorization.

Note that your maximum possible score will depend on both the extent of your calculation (mass and count, count only, or no CoHCs) and the reference list used.

The lists can be found on the CFP website in two locations. Without logging in as a responder, see <https://www.chemicalfootprint.org/assess/cfp-tool-guidance-document-request>. Logging in as a responder, see <https://www.chemicalfootprint.org/assessment-tool>.

The Chemical Footprint Project compiled the CFP CoHC 2018List from 14 lists of hazardous chemicals developed by governments and other authoritative bodies. The CFP CoHC 2018 List includes any chemical or chemical group that meets any combination of the CFP

criteria for a CoHC on any of the 14 lists. Substances on these lists that could not plausibly be an intentionally added ingredient of a product were excluded from the CFP CoHC 2018 List (e.g., viruses, alcoholic beverages). The source lists and links to their websites can be found in Appendix D.

While each source list is dynamic, to simplify reporting the CFP CoHC 2018 List is static and reflects chemicals and chemical groups from the sources lists that meet the CFP definition of a CoHC as of October 31, 2018. The CFP CoHC list aligns with the approach used by GreenScreen® for Safer Chemicals to identify CoHCs, known as “*List Translator-1*” chemicals (LT-1s).

Note that if you choose to use the EU Candidate SVHC List, calculating your chemical footprint to be zero due to the lack of SVHCs is not an option.

- **Count or mass:** Companies may choose to measure CoHCs in their products by either count or by mass.

Maximum Points for Calculating Chemical Footprint

Reference List	Mass & Count	Count only	No CoHCs
Option 1: CFP CoHC 2018 List	8 points	4 points	8 points
Option 2: EU Candidate SVHC List	4 points	2 points	n/a

To measure your company’s chemical footprint:

1. Choose the scope of the footprint. For 2018, we are asking companies to determine the total mass/count of chemicals of high concern in the products they sell over the course of a year. We are not asking companies to determine CoHCs used in their manufacturing operations and by their suppliers, and contained in packaging, though this information may be requested in the future. Responders may also choose to report the chemical footprint for a limited part of their product portfolio, for example, one product line or products produced by one division of the company. The extent of the footprint scope should be indicated in pre-questions 2 and 3.

2. Select a reference list, either the CFP CoHC 2018 List or the EU Candidate SVHC List.

3. Determine which chemicals on your chosen reference list occur in products within your given scope. Sources for this information will vary by company, but likely will largely be derived from chemical ingredient information provided by your suppliers. Generally, the more complete and accurate the chemical ingredient information from your suppliers, the more accurate your chemical footprint calculation. Other possible sources may include: internal knowledge of product formulations, manufacturing inputs purchased by your company, data from product teardowns conducted to verify supplier data, literature reviews, and subject expertise.

The number of chemicals of concern from your chosen reference list that occur in products across your chosen scope is your chemical footprint by count. Note that the count is the total of individual CoHCs added up across all products. For example, one product category contains methylene chloride, another product category contains DEHP and cadmium, and a third product category contains cadmium. Therefore the total count is three CoHCs.

4. Determine the mass of chemicals from your chosen reference list in products within your given scope. Data sources to calculate mass vary by company, but may include volume of materials or parts purchased, product specifications, product sales data, or other sources.

The mass of chemicals of concern from your chosen reference list that occur in products across your chosen scope is your chemical footprint by mass. Report the total in kilograms.

CFP sets threshold levels for calculating chemical footprint as follows:

- For formulated products:** a company includes:
- 100% of the intentionally added CoHCs by mass and
 - any likely impurities that are both a CoHC and present at 100 parts per million (ppm) or higher in the formulation.

Footprint Measurement (F) (CONTINUED)

For articles: a company includes:

- 95% of the intentionally added CoHCs by mass and
- Any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.

The chemical compositions of cotton, down, wood, wood fiber, and wool are exempt from inclusion in calculating the chemical footprint of your company's products. However, all treatments, including dyes, finishes, pigments, etc., must be included.

If your company does not use CoHCs in its products and publicly discloses this information, select "c" and provide supporting documentation to receive full credit for this question.

Below are two examples of how to calculate your chemical footprint. The first, ABC Company, calculates a chemical footprint by mass using the full CFP CoHC 2018 List as its reference list. The second, Zapp Electronics, calculates a partial chemical footprint, identifying the number of SVHC chemicals in its product portfolio. We encourage responders to calculate their chemical footprint using the most comprehensive data they have available.

Example 1: ABC Company: Chemical Footprint by Mass, using the CFP CoHC 2018 List

Company Information

The fictional ABC Company has developed formulations for and produces three products: ABC Lotion, ABC Shampoo, and ABC Cream.

Product Formulas:

ABC Company Lotion:

Material	Percent
A	75
C	23
F	1
G	1

ABC Company Shampoo

Material	Percent
B	68
D	30
E	2
F	1

ABC Company Cream

Material	Percent
A	60
B	20
C	18
F	1
G	1

Quantity Sold in 2018

Product	(million kg)
Lotion	1000
Shampoo	2000
Cream	3000

Chemical Footprint Calculation

1. Choose the scope of the footprint. ABC Company will calculate its chemical footprint for its entire product portfolio for 2018.

2. Select a reference list. ABC Company chooses to use the CFP CoHC 2018 List to calculate its chemical footprint.

3. Determine which chemicals on your chosen reference list occur in products within your given scope. Comparing its list of ingredients to the CFP CoHC 2018 List, ABC Company determines that materials C, F, and G are listed on the CFP CoHC 2018 List.

ABC Company's 2018 chemical footprint by count is 3.

4. Determine the mass of chemicals from your chosen reference list in products within your given scope. Using a combination of its product formulas and data on products sold in 2018, ABC Company calculates the total mass of CoHCs across all products:

Product	Material C (million kg)
ABC Lotion	230
ABC Shampoo	0
ABC Cream	540
Total	770

Product	Material F (million kg)
ABC Lotion	10
ABC Shampoo	20
ABC Cream	30
Total	60

Product	Material G (million kg)
ABC Lotion	10
ABC Shampoo	20
ABC Cream	30
Total	60

ABC Company's 2018 chemical footprint by mass is:
 $770 + 60 + 60 = 890$ million kg

Example 2: Zapp Electronics: Partial Chemical Footprint by Number, Using the EU SVHC List

Company Information

The fictional Zapp Electronics produces laptops, hard drives, printers, and monitors through contract manufacturers. The laptops and hard drives are sold to both European and North American markets, manufactured to consistent specifications. Printers and monitors are sold only to the North American market. In compliance with the European Union's REACH regulation, Zapp tracks the presence of chemicals on the EU Candidate SVHC List for its laptops and hard drives, though it does not track this information by mass.

Chemical Footprint Calculation

1. Choose the scope of the footprint. Based on the product lines for which it has chemical ingredient information, Zapp Electronics chooses to calculate its chemical footprint for its laptops and hard drives sold in 2018. It indicates this in pre-question 2.

2. Select a reference list. Again, given the its availability of chemical ingredient information, Zapp chooses to calculate its chemical footprint based on the EU Candidate SVHC List.

3. Determine which chemicals on your chosen reference list occur in products within your given scope. Based on its data tracking SVHCs in laptops and hard drives, Zapp knows that its laptops contain 15 chemicals on the EU Candidate SVHC List and its hard drives contain 12. Seven of the SVHCs are found in both the laptops and the hard drives; therefore, 20 SVHCs are found in Zapp's laptops and hard drives.

Zapp Electronics' 2018 chemical footprint by count is 20.

4. Determine the mass of chemicals from your chosen reference list in products within your given scope. As Zapp does not track the mass of SVHCs in its products, it is unable to complete this calculation.

Alignment with other frameworks

UN Sustainable Development Goals: SDG Indicators 3.9, 6.3, 12.4

Sustainability Accounting Standards Board:

Supporting Documentation

Please describe a narrative summary of how you calculate your company's baseline chemical footprint.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

F3. Over the most recent year for which you have data, how much have intentionally added CoHCs in your products changed? (8 points)

Response Options

- a. Our company’s difference in the number of intentionally added CoHCs/SVHCs in products (total number of COHCs/SVHCs at beginning of reporting period minus total number of CoHCs/SVHCs at end of reporting period): ____ CoHCs/SVHCs by count
- b. Our company’s difference in the mass of intentionally added CoHCs in products (total mass of COHCs/SVHCs at beginning of reporting period minus total mass of CoHCs/SVHCs at end of reporting period): ____ CoHCs/SVHCs by mass (kg)
- c. Our company is unable to calculate baseline chemical footprint for beginning of reporting period. However, the number and/or mass of intentionally added CoHCs changed by the following amount over the reporting period: _____
- d. Our company’s products did not contain intentionally added CoHCs for the reporting period.
- e. Our company is unable to answer this question at this time.

Please indicate the reference list used:

- ____ CFP CoHC 2018 List
- ____ EU Candidate SVHC List

Intent

This question asks for a quantitative measurement of changes in intentionally added CoHCs in your company’s products over the past reporting year.

Explanation

Options “a” and “b” require the calculation of chemical footprints for the beginning and end of the reporting period. Subtract the footprint for the end of the reporting period from the footprint at the beginning of the reporting period by count and/or by mass. See question F2 for detail on the calculation of a chemical footprint.

As in F2, scoring for options “a” and “b” will reflect the extent to which the footprints are calculated.

Maximum Points for Calculating Change in Chemical Footprint

Reference List	Mass & Count	Count only	No CoHCs
Option 1: CFP CoHC 2018 List	8 points	6 points	8 points
Option 2: EU Candidate SVHC List	4 points	2 points	n/a

Footprint Measurement (F) (CONTINUED)

Option “c” is designed for responders that are unable to calculate their chemical footprint for both the beginning and the end of the reporting period, but have reduced or phased out the use of some number of CoHCs over the course of the reporting period. For example, a company that has reduced its use of lead by 3,000 kg and antimony by 2,000 kg over the reporting period, it would select option “c” and enter - 5,000 kg for change in mass of CoHCs. Likewise, if a company completely phased out its use of 8,000 kg of cadmium, it would select option “c” and enter -1 for change in number of CoHCs and -8,000 kg for change in mass of CoHCs. Because responses to option “c” lack the context of a chemical footprint, it is worth 2 points.

Note that points are based on the ability to calculate the change in the use of CoHCs, not the change itself. Therefore, companies will receive points for answering this question and will not be penalized if the calculation shows increased use of CoHCs.

If your company does not use CoHCs in its products and publicly discloses this information, select “d” and provide supporting documentation to receive full credit for this question.

Alignment with other frameworks

UN Sustainable Development Goals: SDG Indicators 3.9, 6.3, 12.4

EPEAT

1. Imaging Equipment, IEEE 1680.2: 4.1.7.1
2. Televisions, IEEE 1680.3: 4.1.8.1
3. PV, NSF 457: 5.2.5

For further details on the EPEAT standards, see Appendix E.

Supporting Documentation

Please share your progress on reducing CoHCs in the products you sell. Please provide a list of the CoHCs that your company has reduced or eliminated and mass reduced in kg per chemical. If your company does not use CoHCs in its products, please provide documentation.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

F4. How does your company assess the hazards of chemicals in its products and for what percent of your products has your company assessed these hazards? (3 points)

Response Options

Check all that apply.

- Our company uses a system or tool (internal or third party) to evaluate chemical hazards. Identify the system or tool: _____ .
- Our company asks suppliers to provide their evaluations of chemical hazards in the products they sell to us.
- For what percentage of products has your company assessed these hazards, using methods in a and/or b? _____ .
- Our company does not currently assess the hazards of chemicals in its products beyond regulatory requirements.

Intent

This question asks how and to what extent your company assesses chemical hazards in your products beyond regulatory requirements. Many companies begin by reviewing Safety Data Sheets and/or evaluating CAS numbers against authoritative lists of hazardous chemicals. However, Safety Data Sheets have their limitations because they often do not contain a complete ingredient listing because of confidential business information. **Please note that the use of Safety Data Sheets alone is insufficient to receive credit for this question.**

Authoritative lists of chemicals of concern are useful but are considered to be lagging indicators of chemical hazard as it takes time to add chemicals of concern when new scientific evidence becomes available. To conduct a comprehensive evaluation it is necessary to go beyond Safety Data Sheet and authoritative lists. Appendix B details the criteria CFP uses to identify CoHCs that may not be on authoritative lists.

Explanation

Companies often use in-house expertise or hire a qualified third party such as a certified toxicologist to conduct a review of chemical hazards. To conduct a

thorough evaluation, it is expected that the in-house expert or qualified third party will at a minimum evaluate chemical ingredients for the following hazard endpoints: carcinogenicity, mutagenicity, reproductive toxicity, persistence, bioaccumulation, aquatic toxicity (chronic and acute), and endocrine disruption.

There are a number of evaluation tools available and third party service providers that provide this service. The Organization for Economic Cooperation and Development's (OECD's) *Substitution and Alternatives Assessment Tool Box* includes a filterable inventory of chemical hazard surveys, data sources, and service providers to help organizations identify tools most relevant to their substitution and alternatives assessment goals.

To gather additional information on chemical hazards, companies may request that their suppliers evaluate chemicals and provide the results of these reviews. Suppliers may do these evaluations in-house if there is sufficient expertise, or may engage a qualified third party to conduct a review.

Respondents will receive points according to the percentage of their products for which they assess hazard (option "a") and/or for which they receive information from their suppliers (option "b").

Footprint Measurement (F) (CONTINUED)

Examples

GreenScreen™ List Translator (GS-LT): This tool is an abbreviated version of GreenScreen® for Safer Chemicals, a globally recognized chemical hazard assessment method used to identify chemicals of high concern and safer alternatives.

The GreenScreen List Translator provides a “list of lists” approach to quickly identify chemicals of high concern. It does this by scoring chemicals based on information from over 40 hazard lists developed by authoritative scientific bodies convened by international, national and state governmental agencies, intergovernmental agencies and NGOs. These GreenScreen Specified Lists include REACH categorizations and chemical hazard classifications by countries using the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). Each of the GreenScreen Specified Lists is mapped to hazard endpoints and a hazard level or range based on the GreenScreen Hazard Criteria.

Similar to a full GreenScreen assessment, the hazard classifications for endpoints are then used to derive a GreenScreen List Translator score. The List Translator scoring criteria align with the GreenScreen Benchmark-1 criteria. A List Translator score of “LT-1” means the hazard classifications for a given chemical meet one or more of the GreenScreen Benchmark-1 criteria. This information is based on authoritative lists; if a full GreenScreen assessment were conducted, the chemical would most likely be a Benchmark-1 chemical. A List Translator score of “LT-P1” means the hazard classifications for a given chemical meet one or more of the GreenScreen Benchmark-1 criteria, but the information is based on screening lists and/or there is some uncertainty about the classification for key endpoints. Further research is needed on the flagged endpoint(s) to determine if the chemical is indeed a GreenScreen Benchmark-1. A List Translator score of “LT-UNK” indicates that although the chemical was present on a list, there is insufficient information to apply the scoring algorithm to the chemical.

The GreenScreen List Translator is helpful in identifying chemicals that are on authoritative lists. It does not evaluate chemicals that may be of concern but are not on a list. These chemicals can be evaluated by doing a search of the toxicological literature for the health endpoints identified above. One approach is to conduct a full GreenScreen assessment on these chemicals. More information on the full GreenScreen method is available here: <https://www.greenscreenchemicals.org/learn/full-greenscreen-method>

Health Product Declaration®: Another model for evaluating the hazard of chemical ingredients in products is the Health Product Declaration® (HPD). The HPD was designed for evaluating the material contents of building products and provides a standardized way of reporting these contents and the health effects associated with these materials.

Materials are listed in descending order of quantity. Each of the substances listed are screened for their chemical hazard and receive a score. This score can either be a GreenScreen List Translator score, which indicates the chemical has been evaluated to see if it is found on an authoritative list of chemicals of concern or a GreenScreen Benchmark score, which indicates that the chemical has undergone a more complete toxicological assessment. Information on the Health Product Declaration can be found here: <https://www.hpd-collaborative.org/>

Alignment with other frameworks

Sustainability Accounting Standards Board:

Supporting Documentation

Identify and describe the system or tool or third party provider that your company uses. Indicate what percent of products are screened for hazard.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Footprint Measurement (F) (CONTINUED)

F5. How does your company encourage the use of safer alternatives to CoHCs? (6 points)

Response Options

Check all that apply in “a – f” or answer only “g” or “h.” Our company:

- a. has developed a definition for a safer alternative that is consistent with the CFP definition, and we include such criteria in our business processes.
- b. communicates about and asks suppliers to use our company’s criteria for a safer alternative.
- c. rewards suppliers that use safer alternatives.
- d. has integrated our company’s criteria for a safer alternative into our product development process (e.g., through our design and safety processes).
- e. has established a goal and is tracking progress to improve the profile of chemicals across our products, consistent with our company’s criteria for a safer alternative.
- f. publicly discloses our company’s definition for a safer alternative and our approach to integrating it into our business practices. Provide web link: _____ .
- g. does not have products that contain CoHCs (please describe in documentation how it ensures that the safest chemicals available are used).
- h. does none of the above.

Intent

This question inquires about how your company encourages the use of safer alternatives to chemicals of concern. CFP defines a safer alternative as a chemical that due to its inherent chemical and physical properties exhibits a lower propensity to persist in the environment, accumulate in organisms, and induce adverse effects in humans or animals than chemicals in current use. In addition, the alternative must deliver the needed functional performance. A safer alternative may eliminate the need for the chemical through material change, product re-design, or product replacement; or by altering the functional demands for the product through changes in consumer demand, workplace organization, or product use.

Explanation

To encourage the use of safer alternatives, it is important that a company has defined this term and communicated its meaning and criteria to its suppliers. CFP encourages

companies to define safer alternative in a manner that is consistent with the definition above. It is also important that criteria for safer alternatives are integrated into the product development process. Goal setting and tracking progress in regard to adoption of safer alternatives is also key. In addition, public disclosure of your company’s definition of safer alternatives and your approach to implementation indicates that your company takes improved chemicals management seriously.

The search for safer alternatives is an iterative process and often requires the use of alternatives assessment methods to compare chemical hazards, evaluate trade-offs, and determine whether a safer alternative is technically feasible and commercially available. The OECD’s [Substitution and Alternatives Surveybox](#) includes a filterable inventory of chemical hazard surveys, data sources, and service providers to help organizations identify tools most relevant to their substitution and alternatives assessment goals.

Some companies develop lists of preferred chemicals or provide positive criteria for chemicals (for example, biodegrades readily). Including requirements for safer alternatives in contracts can motivate suppliers to seek out safer chemicals and materials. If these alternatives are not commercially available, these requirements can stimulate green chemistry research and development. Green chemistry is the design of chemical products and processes that reduce or eliminate the use and generation of hazardous substances. Green chemistry applies across the life cycle of a chemical product, including its design, manufacture, and use and includes [12 fundamental principles](#).

If your company's products do not contain CoHCs, select option "g" and attach a narrative summary describing how it ensures that the safest chemicals available are used.

Note that you can check all that apply.

Example

Nike, Inc.'s "[Green Chemistry Program](#)" meets Response Options "a," "b," "c," "d," and "f." Specifically, Nike:

- "encourages all suppliers to use the Principles of Green Chemistry to inspire innovation. Designing and producing materials around these principles can be used at any stage in the supply chain to improve sustainability as well as protect the consumer, employee, and the community/environment" and
- asks that suppliers voluntarily: "Commit to self-evaluate the use of toxic chemicals in their facility" and "Validate their chemical greening efforts for materials or processes."

Alignment with other frameworks

Sustainability Accounting Standards Board:

1. Standard: Household & Personal Products (draft)
Topic: Product Environmental, Health and Safety Performance
Metric: Revenue from products designed with green chemistry principles

EPEAT

1. Mobile Phones, UL 110: 7.3.1
2. Servers, NSF 426: 6.2.5, 6.2.6
3. PC&D Revision, IEEE 1680.1 (2018): 4.1.8.1
4. PV, NSF 457: 5.1.5

For further details on alignment with other sustainability frameworks, see Appendix E.

Supporting Documentation

Provide a narrative summary of your company's efforts to encourage the use of safer chemicals. To receive credit for option "f," provide a link to your company's definition of safer alternative and how it is integrated into your company's business practices. If you choose "yes" for question D2, this link will be included in your publicly available responses.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Public Disclosure and Verification (D) (20 POINTS)

D1. What information does your company disclose about the chemical ingredients in its products? (8 points)

Response Options

Response options for D1 are divided into two parts: D1.a. for formulated products and D1.b. for articles. Answer all that apply.

D1.a. Enter the percentages for all that apply. For formulated products, our company publicly discloses:

- i. Chemical identity beyond legal requirements for ____ percentage of sales at the SKU level.
- ii. All intentionally added chemicals including fragrances, flavors, and preservatives in products for ____ percentage of sales at the SKU level.
- iii. We do not publicly disclose information about chemical ingredients in our formulated products beyond legal requirements.

D1.b. Enter the percentages for all that apply. For articles, our company publicly discloses:

- i. Generic material content for 95% by mass of chemicals in products for ____ percentage of sales or spend at the SKU level.
- ii. Chemical identity for 95% by mass of chemicals in products for ____ percentage of sales or spend (e.g., Health Product Declaration).
- iii. We do not publicly disclose information about chemicals in our articles beyond legal requirements.

Provide web link(s) to online ingredient disclosure: _____ .

Intent

Increasingly, stakeholders want to know the chemical ingredients in products. This question inquires about public disclosure of chemical ingredient information in formulated products and articles that your company sells. For many formulated products, companies are legally required to disclose certain chemical ingredients. This question seeks to understand how far beyond legal reporting requirements companies are progressing in terms of disclosing to the public chemical ingredient information about their products, either on their websites or packaging.

Explanation

Similar to question I4, possible response options for this question will be determined by your response to Pre-question 3, which asks whether, for the scope of your product portfolio you are reporting on, your company sells formulated products, articles, or both. The type

of product sold will not impact your score. To receive points for this question disclosure must be at the SKU level on packaging or on your company's website.

For formulated products:

- **D1.a.i.:** Companies selling formulated products may receive points for ingredient disclosure beyond legal requirements at the SKU level either on the package or website. For example, companies in the building product sector providing Health Product Declarations for their formulated products would receive points here.
- **D1.a.ii.:** this response option is disclosure of all ingredients, including fragrances, by SKU, on package or website. Ingredients should be named according to industry standards, specifically: the International Nomenclature Cosmetic Ingredient (INCI) name, the International Union of Pure and Applied Chemistry

(IUPAC) name, Chemical Abstract Service (CAS) name, or Consumer Specialty Products Association (CSPA) Dictionary name. Generic names, such as “fragrance,” “perfume,” “flavor,” or “preservative” are not accepted as disclosure. For example, see [Seventh Generation’s formulated products](#), which include full ingredient disclosure by product. Beautycounter also lists all ingredients for all of its products on its [website](#).

For articles:

- **D1.b.i.:** to receive points for this response option a company must disclose generic material content for 100% by mass of chemicals in products. Generic material content is defined as the general name of a material, such as steel, nylon fabric, adhesive, or type of plastic (e.g., polyethylene terephthalate (PET)). CAS# is not required. For example, see [Construction Specialties’ disclosure of generic ingredient content](#) on its products.
- **D1.b.ii.:** to receive points for this response option companies must disclose chemical names for 95% by mass of chemicals in a product. For example, see [Seagate’s disclosure of chemical ingredient](#) for its hard drive.

Please provide the percentage of sales for which this information is disclosed. If your company sells both formulated products and articles, please answer both parts of this question.

Supporting Documentation

Please provide information on whether this information is disclosed on packaging or on your company’s website. In addition, please explain how chemicals covered by non-disclosure agreements (NDAs) are disclosed. For example, are they disclosed separately from the products with which they are associated? Demonstrate how your disclosure goes beyond legal requirements. To receive credit for this question, unless ingredient disclosure is included only on packaging, relevant links must be provided. If you select “yes” for D2, these links will be included in your public responses.

File Upload

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Public Disclosure and Verification (D) (CONTINUED)

D2. Does your company agree to publicly disclose its responses to the CFP Survey? (3 points)

Response Options

Our company agrees to disclose its score publicly on the CFP website. Answer “a” or “b:”

- a. Yes ____
- b. No ____

Explanation

If you select “yes,” your multiple choice response options, in addition to any web links provided in response to questions M1, I2, F1, F5, and D1 will be made available on the CFP website.

D3. Does your company agree to publicly disclose its CFP Survey score? (5 points)

Response Options

Our company agrees to disclose its score publicly on the CFP website. Answer “a” or “b:”

- a. Yes ____
- b. No ____

Explanation

If you select “yes,” your score will be posted on the [CFP website](#).

D4. Have any of your company's responses to the questions in the Survey been verified by an independent third party? (4 points)

Response Options

Check only one response option. Our company's response options have been verified by an independent third party for:

- a. none to one of our response options.
- b. two to four of our response options.
- c. at least eight of our response options.
- d. at least twelve of our response options.
- e. all response options except D2, D3, and D4.

Intent

Stakeholders have expressed concern that company answers to the CFP Survey are not independently verified. CFP will perform quality assurance and quality control review of responses based on information provided by companies as well as publicly available information. CFP will not perform an independent third party review of all responses by a company. CFP encourages third party verification of responses and provides points to companies that undertake this effort.

Explanation

To receive points for D4 you must attach an assurance statement from an independent third party verifying the authenticity for each response option for which you claim credit. The verification must clearly relate to each response option in the CFP Survey.

CFP verification procedures draw on those used by other organizations, such as the Global Reporting Initiative (GRI) and the Carbon Disclosure Project (CDP). These organizations identify high level principles, define specific guidelines, and either refer directly to, or specifically approve international assurance standards such as the International Auditing and Assurance Standards Board's (IAASB) ISEA 3000, an international framework

for assurance engagements, and AccountAbility's AA1000AS Assurance Standard, designed to confirm the accuracy and quality of sustainability performance and reporting.

Before contracting with a third party for verification of response options to the Survey questions, CFP recommends sharing this Guidance Document with potential contractors and determining whether they comply with the guidelines in the table below. The documentation outlined in Table 1 (p. 46), along with the verification results, should be shared with the CFP when responding to question D4. CFP will not disclose the documentation or the verification results without permission from responders.

Choose one response option, "a – d."

Supporting Documentation

Provide document with third party verification statement.

Please upload supporting documentation. Acceptable file extensions are: doc|docx|xls|xlsx|mpp|txt|pdf|jpg|jpeg|ppt|mp3.

Public Disclosure and Verification (D) (CONTINUED)

Guidelines for the CFP Survey Question D4—Verification

Guideline	Description
Independence	There should be unambiguous separation of responsibilities for preparation of the chemicals management verification report from those who are ultimately accountable for the data. Use of third party organizations is required to perform this verification.
Competence & Ethics	<p>Verification practitioners should be clearly competent in both verification and chemicals management practices. The verifying company should have consistent and documented verification project standards that are required to be used for all verification projects.</p> <p>The verifying company and its practitioners should be subject to a code of ethics consistent with or as demanding as the International Ethics Standards Board for Accountants' (IESBA) Code of Ethics for Professional Accountants related to assurance engagements, and including standards for integrity, objectivity, professional competence, and due care.</p>
Subject Matter	The chemicals management data content should be relevant to the end users of the information and should be capable of being objectively measured.
Criteria	The verifying company should use a documented and consistent methodology for performing the verification procedures, and should demonstrate to the responder company how its methodology meets the CFP Verification Guidelines.
Quality Control	<p>The verifying company's quality control structure should be consistent with International Standard on Quality Control's ISQC 1 guidelines, designed to maintain a high level of quality of verification work. The ISQC Quality Control system includes guidelines on:</p> <ul style="list-style-type: none"> • leadership responsibilities for quality within the company; • ethical requirements; • requirements whether to accept, continue, or discontinue an engagement; • human resources management; • how to be sure engagements are performed appropriately; and • monitoring the quality control system to maintain its adequacy and effective operation
Sufficient and appropriate evidence	The verifying company should determine to what extent the information is being reported in a reasonable and balanced manner, and whether the available data are sufficient to make that determination.
Results Report	The verifying company should produce a Results Report for the intended audience with its assessment of the veracity of the chemicals management information reviewed. The intended audience for the report may range from purely internal resources, to external stakeholders, to the general public. The Results Report should be shared with the CFP to confirm performance of the verification work.

Appendix A

Chemicals in Products: Terms, Definitions, Examples, and Scope

Term	Definition	Example(s)	Scope
Chemical of Concern	A chemical that is of moderate to high concern for ecotoxicity or human toxicity, but is not a CoHC.	GreenScreen Benchmark 2	Broader than CoHCs and narrower than full chemical ingredient information.
Chemical of High Concern (CoHC)	A chemical that meets any of the following criteria: <ul style="list-style-type: none"> • Carcinogens, mutagens and reproductive toxicants (CMRs);* • persistent, bioaccumulative and toxic substances (PBTs); • any other chemical for which there is scientific evidence of probable serious effects to human health or the environment that give rise to an equivalent level of concern (for example, an endocrine disruptor or neurotoxicant); or is • a chemical whose breakdown products results in a CoHC that meets any of the above criteria. 	Chemical Footprint Project Chemicals of High Concern 2018 List	~2,200 chemicals and chemical groups that meet the CFP definition of CoHC as of October 31, 2018.
Full Chemical Ingredient Information	<p>For formulated products: a company knows 100% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 100 ppm or higher in the formulation.</p> <p>For articles: a company knows 95% of the intentionally added substances by mass and any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.</p>	Seagate requirement for Full Materials Disclosure, Health Product Declaration, etc.	Broadest number of chemicals
Restricted Substances List	A list of chemicals restricted by a company in products, parts, or components from its suppliers. A RSL may include only chemicals that are currently restricted by regulation. It may also include chemicals that are not yet legally restricted but have been identified as being of concern because of scientific evidence that they may cause harm to human health or the environment.	American Apparel & Footwear Association	Chemicals restricted by a government anywhere in the world.

* CMRs that meet CoHC criteria include: Globally Harmonized System (GHS) for the Classification and Labeling of Chemicals Category 1A (Known) or 1B (Presumed) for any route of exposure

Appendix B

Chemical Footprint Project—Criteria for Determining Chemicals of High Concern

The Chemical Footprint Project (CFP) defines a chemical of high concern (CoHC) in alignment with adverse health effects specified in REACH and determined by GHS Categories. Substances that meet the following GHS categories are CoHCs in the CFP:

- Carcinogenicity (C): GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
- Mutagenicity/Genotoxicity (M): GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
- Reproductive Toxicity (R): GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
- Systemic Toxicity/Organ Effects: GHS Category 1 Single Exposure for any route of exposure or GHS Category 2 Single Exposure for any route of exposure

Note: The GHS does not have criteria for persistence and bioaccumulation.

Health Endpoints	GHS Information Source	GHS Category
Acute Aquatic Toxicity (AA)	GHS Criteria & Guidance	GHS Category 1, ≤1; GHS Category 2, >1 to 10
Carcinogenicity (C)	GHS Criteria & Guidance	GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
Chronic Aquatic Toxicity (CA)	GHS Criteria & Guidance, Guidance Value (mg/L)	≤1; >0.1 to 1.0
Developmental Toxicity (D)	GHS Criteria & Guidance (Note: GHS Reproductive Toxicity includes both reproductive and developmental effects, while the GreenScreen separates them into two distinct hazard endpoints. This classification must be based on reproductive effects alone.)	GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
Mutagenicity/Genotoxicity (M)	GHS Criteria & Guidance	GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
Neurotoxicity (N)	GHS Criteria Systematic Toxicity/Organ Effects using US EPA Risk Assessment Guidance to define applicable neurotoxic effects.	GHS Category 1 Single Exposure for any route of exposure; GHS Category 2 Single Exposure for any route of exposure
Reproductive Toxicity (R)	GHS Criteria & Guidance (Note: GHS Reproductive Toxicity includes both reproductive and developmental effects, while the GreenScreen separates them into two distinct hazard endpoints. This classification must be based on reproductive effects alone.)	GHS Category 1A (Known) or 1B (Presumed) for any route of exposure
Systemic Toxicity/ Organ Effects (ST)	GHS Criteria & Guidance	GHS Category 1 Single Exposure for any route of exposure; GHS Category 2 Single Exposure for any route of exposure

Appendix C

Glossary of Terms¹

Alternatives Assessment—A process for identifying, comparing and selecting safer alternatives to chemicals of concern (including those in materials, processes or technologies) on the basis of their hazards, performance, and economic viability. A primary goal of Alternatives Assessment is to reduce risk to humans and the environment by identifying safer choices.

Article—An object which during production is given a special shape, surface or design which determines its function to a greater degree than its chemical composition.²

Brand—The originator of the final product and owner of any associated label/trademark. “Brand” includes a retailer’s private label/private brand products.

Chemical (see also **Substance**)—

- **in Product (Chemistry)**—Chemicals that are intended to be part of the finished product. An example is a durable water repellent chemical formulation that is applied to a textile. Another example is a chemical plasticizer added to a plastic product or component.
- **Management Process**—A task or function towards a defined goal or objective. The combination of related processes comprises a management system.
- **Management System**—The set of procedures an organization needs to follow in order to meet its objectives (reference: ISO). A “chemicals management system” describes the set of procedures an organization needs to follow to meet its chemicals management objectives.
- **Manufacturer**—The company that manufactures the chemical product/substance.
- **Process (Chemistry)**—Any chemical or substance used in a process to make a product.
- **Product**—Synonymous with chemical and chemical substance.
- **Substance**—Synonymous with chemical product and chemical.

- **Supplier**—The company that sells the chemical product (may or may not be the manufacturer of the chemical; may be a formulator).
- **Safer (Chemistry)**—A chemical that due to its inherent chemical and physical properties, exhibits a lower propensity to persist in the environment, accumulate in organisms and induce adverse effects in humans or animals.

Chemical Footprint—The total mass of chemicals of high concern (CoHCs) in products sold by a company, used in its manufacturing operations its facilities and by its suppliers, and contained in packaging. Understanding the challenge of calculating a chemical footprint, for 2018, the Chemical Footprint Project asks participating companies to calculate either the total mass or count of chemicals of high concern (CoHCs) in the products they sell. Alternately, companies are given the option to calculate their chemical footprint based on a relatively short list of chemicals, the European Union’s Candidate List of Substances of Very High Concern for Authorization (EU Candidate SVHC List). We are not asking companies to determine CoHCs used in their manufacturing operations, their facilities, by their suppliers, or contained in packaging, though this information may be requested in the future.

For more details on how to calculate a chemical footprint, see page 30.

Chemical Footprinting—The process of assessing progress toward the use of safer chemicals and away from chemicals of high concern to human health or the environment.

Chemical Hazard Assessment—The process of determining whether a chemical is capable of causing adverse effects to humans and the environment and the circumstances under which these effects may occur.

1 Adapted from the OIA Chemicals Management Framework Glossary: <http://outdoorindustry.org/responsibility/chemicals/cmpilot.html>

2 See <http://www.reach-compliance.eu/english/REACH-ME/engine/sources/definitions.html>

Chemical of Concern—A chemical that is of moderate to high concern for ecotoxicity or human toxicity, but is not a Chemical of High Concern (CoHC).

Chemical of High Concern—A chemical that meets any of the following criteria:

- Carcinogenic, mutagenic, or toxic to reproduction (CMR);
- Persistent, bioaccumulative and toxic substance (PBT);
- Any other chemical for which there is scientific evidence of probable serious effects to human health or the environment that give rise to an equivalent level of concern (for example, an endocrine disruptor or neurotoxicant); or
- A chemical whose breakdown products result in a CoHC that meets any of the above criteria.

Using this definition, the Chemical Footprint Project compiled the CFP CoHC 2018 List from 14 lists of hazardous chemicals developed by governments and other authoritative bodies. The CFP CoHC List includes any chemical or chemical group that meets any combination of the CFP criteria for a CoHC on any of the 14 lists. Substances on these lists that could not plausibly be an intentionally added ingredient of a product were excluded from the CFP CoHC List (e.g., viruses, alcoholic beverages). The source lists and links to their websites can be found in Appendix D.

While each source list is dynamic, to simplify reporting the CFP CoHC 2018 List is static, reflecting the underlying lists as of October 31, 2018. .

The CFP CoHC 2018 List aligns with the approach used by GreenScreen® for Safer Chemicals to identify CoHCs, known as “[List Translator-1](#)” chemicals (LT-1s).

Chemicals in products—Chemicals that are intended or anticipated to be part of the finished product. Examples include dyes, silicone finishes, screen printing, inks, labels, a durable water repellent chemical formulation, or a chemical plasticizer added to a plastic product or component.

Chemicals Policy—A statement of how a company manages chemicals in its materials, supply chains, products, and operations beyond what is required by regulation.

Component—Substance intentionally added to form a preparation.³

Disclosure—Synonymous with “public disclosure,” meaning that information is available to the general public through means such as print media, Internet/web sites, in annual progress and sustainability reports, at investor and stakeholder meetings, or on packaging.

Endpoint—A discrete, measured parameter or outcome in a study (e.g., toxicological or environmental fate).

Environmental

- **Impact**—Effects on the environment from exposure to the release of chemicals to water, soil, or the atmosphere. These effects may be positive or negative and may come from individual or cumulative releases of chemicals.
- **Exposure**—Medium (e.g., water, air, dust) by which a substance is released into the environment and route (oral, dermal, inhalation) by which an organism may come in contact with a substance.

Final product—A consumer-ready product (e.g., a shirt for sale to a consumer).

Formulator—A manufacturer of a preparation or a mixture of chemical substances. These can be gaseous, liquid, or solid preparations (paints, liquid cleaning products, adhesives, etc.). The products that formulators make can be intermediate or finished products sold to another formulator, a fabricator, a distributor, retailer, or consumer.

Formulated product—A preparation or mixture of chemical substances that can be gaseous, liquid, or solid (e.g., paints, liquid cleaning products, adhesives, coatings, cosmetics, detergents, dyes, inks, lubricants). Can be an intermediate product sold to another formulator, fabricator, or distributor or final product sold to

3 See <http://www.reach-compliance.eu/english/REACH-ME/engine/sources/definitions.html>

a consumer or retailer. (see also Chemical product, Chemical substance).

Full Chemical Ingredient Information—

For formulated products—A company knows:

- 100% of the intentionally added substances by mass and
- Any likely impurities that are both a CoHC and present at 100 parts per million (ppm) or higher in the formulation.

For articles—A company knows:

- 95% of the intentionally added substances by mass and
- Any likely impurities that are both a CoHC and present at 1000 ppm or higher in a homogeneous material.

Generic material content—The general name of a material, such as steel, nylon fabric, adhesive, or type of plastic (e.g., polyethylene terephthalate (PET)). CAS# is not required.

Global Harmonized System of Classification and Labeling of Chemicals (GHS)—An international system for standardizing and harmonizing the classification and labelling of chemicals.

Green chemistry—The design of chemical products and processes that reduce or eliminate the use and generation of hazardous substances. See The 12 principles of Green Chemistry <http://www.epa.gov/sciencematters/june2011/principles.htm>. See also **Sustainable Chemistry**.

GreenScreen® for Safer Chemicals—A method for comparative Chemical Hazard Assessment (CHA) that can be used for identifying chemicals of high concern and safer alternatives. GreenScreen® considers 18 human and environmental health endpoints and can be used to evaluate the hazard of a single chemical or mixtures and polymeric materials. GreenScreen® uses a set of four benchmarks to screen out chemicals that are associated with adverse health and environmental impacts. Chemicals that do not pass through Bench-

mark 1 are deemed Chemicals of High Concern and should be avoided; chemicals at Benchmark 2 are categorized as usable, but efforts should be taken to find safer alternatives; Benchmark 3 chemicals are those with an improved environmental health and safety profile but could still be improved; and chemicals that pass through all four benchmarks are considered safer chemicals and are therefore preferred.

GreenScreen® List Translator—An abbreviated version of the full GreenScreen® method that can be automated. It is based on the hazard lists that inform the GreenScreen® method. The GreenScreen® List Translator maps authoritative and screening hazard lists, including GHS country classifications, to GreenScreen® hazard classifications. The GreenScreen® List Translator can be accessed through Healthy Building Network's [Pharos Chemical and Material Library](#), a fee-for-service database, the [Chemical Hazard Data Commons](#), or

Hazard (chemical)—inherent property of a substance having the potential to cause adverse effects when an organism, system, or population is exposed, based on its chemical or physical characteristics.⁴

Hazard Assessment—The process of determining under what exposure conditions (e.g., substance amount, frequency and route of exposure) a substance can cause adverse effects in a living system. Toxicology studies are used to identify the potential hazards of a substance by a specific exposure route (e.g., oral, dermal, inhalation) and the dose (amount) of substance required to cause an adverse effect.

Homogenous Material—A material: 1) with a uniform composition throughout; or 2) that consists of a combination of materials, that cannot be disjointed or separated into different materials by mechanical actions such as unscrewing, cutting, crushing, grinding or abrasive processes. Examples of homogeneous materials include a plastic cover to a computer screen, a copper wire inside a cable, and the solder part of a solder joint.⁵

4 See <http://www.oecdsaatoolbox.org/Home/Glossary>

Impurity—An unintended constituent present in a substance as manufactured. It may, for example, originate from the starting materials or be the result of secondary or incomplete reactions during the production process. While it is present in the final substance it was not intentionally added. In most cases impurities constitute less than 10% of the substance.⁵

Life cycle—The stages of a system that begin with the acquisition of raw materials and includes bulk material processing, engineered materials production, manufacture and assembly, use, retirement, and disposal of residuals produced in each stage.

Manufacturer—Entity that makes a good through a process involving raw materials, components, or assemblies, typically with different operations divided among different workers. Commonly used interchangeably with producer.

Manufacturing Restricted Substances List (MRSL)—A list of chemicals banned from intentional use in facilities that process materials, components and/or products. An MRSL establishes acceptable concentration limits for substances in chemical formulations used within manufacturing facilities.⁷

Mass—The quantity of matter in a sample, and the sum of the masses of the components of a sample is equal to the mass of the whole sample. The mass of a particular object is a fixed quantity, but acceleration due to gravity, and therefore weight, varies with location.

Non-disclosure Agreement (NDA)—A legal contract between at least two parties that is designed to protect intellectual property (IP)/trade secret information/confidential business information (CBI).

Non-governmental Organizations (NGOs)—Community, environmental, and/or public interest organizations, excluding industry or trade associations. Examples of NGOs specific to chemicals include:

- BizNGO Working Group
- BlueGreen Alliance
- Campaign for Safe Cosmetics
- ChemSec
- Health Care Without Harm
- Healthy Building Network
- Safer Chemicals Healthy Families Coalition

Persistence—Attribute of a substance that describes the length of time that the substance remains in a particular environment before it is physically removed or chemically or biologically transformed. (IUPAC)

Persistent, bioaccumulative and toxic substance (PBT)—A chemical that is toxic, persists in the environment and bioaccumulates in food chains and, thus, poses risks to human health and ecosystems.⁸

Point of Contact—A person or a department serving as the coordinator or focal point of information concerning chemical information and management systems for a company. Assigning a point of contact is critical where getting information is time-sensitive, accuracy is important, and when good customer relations need to be maintained.

Preferred

- **Substances List**—A list of substances that have been assessed for their human and environmental health attributes, safety, environmental impacts and performance properties and recommended for use.
- **Chemical (Chemistry)**—A chemical or substance which has been assessed for its human and environmental health attributes, safety, environmental impacts and performance properties and recommended for use.

5 http://ec.europa.eu/environment/waste/rohs_eee/pdf/faq.pdf

6 <http://www.reach-compliance.eu/english/REACH-ME/engine/sources/definitions.html>

7 Adapted from ZDHC: <http://www.roadmaptozero.com/programme/manufacturing-restricted-substances-list-mrsl-conformity-guidance>

8 <http://www.reach-compliance.eu/english/REACH-ME/engine/sources/definitions.html>

Preparation—A mixture or solution composed of two or more substances.

Product—

- **Chemistry**—The chemicals in a final product, their hazard characteristics, the potential for exposure to these chemicals and possible harm.
- **Final**—Refers to a consumer-ready product (e.g., a shirt for sale to a consumer).
- **Formulated**—Describes a chemical product that is a physical mixture of other chemical products.
- **Intermediate**—Refers to any item such as components and/or materials and/or substances used to make a final product. An intermediate product is not used by a consumer. An example of an intermediate product is dyed fabric made by a dye house and sold to a cut and sew factory to be made into a garment for a consumer.

Public Disclosure—Information that is available to the general public through means such as print media, Internet/web sites, in annual progress and sustainability reports, and at investor and stakeholder meetings or on packaging.

Public Policy—A system of laws, regulatory measures, courses of action, and funding priorities concerning a given topic promulgated by a governmental entity or its representatives.

REACH—The European Union’s Regulation on Registration, Evaluation, Authorisation and Restriction of Chemicals that entered into force in June 2007. REACH makes industry responsible for assessing and managing the risks posed by chemicals and providing appropriate safety information to users.

Restricted Substances List (RSL)—A list of chemicals restricted by a company in products, parts, or components from its suppliers. A RSL may include only chemicals that are currently restricted by regulation. It may also include chemicals that are not yet legally restricted but

have been identified as being of concern because of scientific evidence that they may cause harm to human health or the environment.

Restriction—Any condition for or prohibition of the manufacture, use or placing on the market.⁹

Retailer—The seller and re-seller of finished product to the end consumer. Some retailers also make private label/store brand products.

Risk Assessment—A process that characterizes the nature and magnitude of health risks to humans (e.g., residents, workers, recreational visitors) and ecological receptors (e.g., birds, fish, wildlife) from chemical contaminants and other stressors that may be present in the environment.

Safer Chemical—A chemical that, due to its inherent chemical and physical properties, exhibits a lower propensity to persist in the environment, accumulate in organisms and induce adverse effects in humans or animals.

Safer Alternative—A chemical that due to its inherent chemical and physical properties exhibits a lower propensity to persist in the environment, accumulate in organisms, and induce adverse effects in humans or animals than chemicals in current use. In addition, the alternative must deliver the needed functional performance. A safer alternative may eliminate the need for the chemical through material change, product re-design, or product replacement; or by altering the functional demands for the product through changes in consumer demand, workplace organization, or product use.

Supplier—Any actor in the supply chain that provides intermediate and/or final products and/or supporting services to brands and/or retailers. This includes: materials, assembly, and finished product suppliers.

⁹ <http://www.reach-compliance.eu/english/REACH-ME/engine/sources/definitions.html>

¹⁰ <http://www.suschem.org/about-suschem/vision-and-mission-sustainable-chemistry.aspx>

Sustainable chemistry—The design, manufacture and use of efficient, effective, safe and more environmentally benign chemical products and processes.¹⁰

Third party—An independent person/entity involved in a project, including chemical assessments, that is not biased to the results of the work nor has any vested interest in the outcome of the work.

Toxic substance—Any chemical or mixture that may be harmful to the environment and to human health if inhaled, swallowed, or absorbed through the skin.

Very bioaccumulative and toxic (vBT)—A substance that exhibits high levels of bioaccumulation AND is toxic to human health or the environment.

Very persistent, very bioaccumulative—A substance

that exhibits high levels of both persistence AND bioaccumulation potential.

Very persistent and toxic (vPT)—A substance that exhibits high levels of persistence AND is toxic to human health or the environment.

Watch List—A list of chemicals of concern that a company does not currently prohibit, but is considering prohibiting in the future due to scientific evidence that a chemical may cause harm to human health or the environment.

Appendix E

Alignment of the CFP Survey and Other Sustainability Frameworks

The CFP Survey questions and response options are aligned with other sustainability frameworks, including the United Nations Sustainable Development Goals (SDGs), the Sustainability Accounting Standards Board (SASB), and criteria used by EPEAT.

CFP Survey Alignment with SASB Metrics

SASB			Relevant CFP Survey Questions & Metrics
Standard	Topic	Metrics	
Apparel, Accessories & Foot-wear (draft)	Management of Chemicals in Products	Description of processes to maintain compliance with restricted substances regulations	I1: Restricted Substances List (RSL) and manufacturing (RSL) I2: Implementation of RSL/MRSL
		Description of processes to assess and manage risks associated with chemicals in products	Footprint Measurement indicators: F2-chemical footprint and F4-hazard assessment
Building Products & Furnishings (draft)	Management of Chemicals in Products	Description of processes to assess and manage risks and/or hazards associated with chemicals in products	Footprint Measurement indicators F2 and F4
		Percentage of applicable products meeting volatile organic compound (VOC) emissions and content standards	I1: VOCs captured under Restricted Substances Lists
Household & Personal Products (draft)	Product Environmental, Health, and Safety Performance	Revenue from products that contain REACH substances of very high concern (SVHC)	F2: Chemical footprint
		Revenue from products that contain substances on the California DTSC Candidate Chemicals List	F2: Chemical footprint
		Discussion of process to identify and manage emerging materials and chemicals of concern	Footprint Measurement indicators F2 and F4
		Revenue from products designed with green chemistry principles	F5: addressed in part, steps to encourage safer alternatives
Toys & Sporting Goods (draft)	Chemical & Safety Hazards of Products	<ul style="list-style-type: none"> Number of recalls and total units recalled Number of Letters of Advice received Amount of legal and regulatory fines and settlements associated with product safety 	Not applicable: CFP Survey does not ask questions concerning regulatory compliance
		Description of processes to assess and manage risks and/or hazards associated with chemicals in products	Footprint Measurement indicators F2 and F4

CFP Survey Alignment with United Nations Sustainable Development Goals

GOAL 3. ENSURE HEALTHY LIVES AND WELL-BEING FOR ALL AT ALL AGES

- **SDG Indicator 3.9:** By 2030, substantially reduce the number of deaths and illnesses from hazardous chemicals and air, water and soil pollution
- **CFP Survey Footprint Measurement questions:** **F1**—set goals to reduce chemical footprint; **F2**—measure chemical footprint; and **F3**—reductions in chemical footprint

GOAL 6. ENSURE AVAILABILITY AND SUSTAINABLE MANAGEMENT OF WATER AND SANITATION FOR ALL

- **SDG Indicator 6.3:** By 2030, improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials
- **CFP Survey Footprint Measurement questions:** **F1**—set goals to reduce chemical footprint; **F2**—measure chemical footprint; and **F3**—reductions in chemical footprint

GOAL 12. ENSURE SUSTAINABLE CONSUMPTION AND PRODUCTION PATTERNS

- **SDG Indicator 12.4:** By 2030, achieve the environmentally sound management of chemicals and all wastes throughout their life cycle
- **CFP Survey:** entire Survey aligns with achieving the “environmentally sound management of chemicals”—in fact, the CFP Survey is a proxy for measuring corporate progress to SDG indicator 12.4.

EPEAT, a program of the Green Electronics Council, is a global eco-label for the IT sector, providing independent verification of manufacturers’ claims for servers, computers and displays, imaging equipment, televisions, mobile phones, and photovoltaic panels. For each product type, EPEAT assesses against individual standards, available at <https://greenelectronicscouncil.org/epeat-criteria>. These include:

- Servers: *NSF/ANSI 426-2017 Environmental Leadership and Corporate Social Responsibility Assessment of Servers*
- Computers and Displays: *IEEE 1680.1™-2018 Standard for Environmental and Social Responsibility Assessment of Computers and Displays*

- Imaging Equipment: *IEEE 1680.2™-2012 Standard for Environmental Assessment of Imaging Equipment*
- Televisions: *IEEE 1680.3™-2012 Standard for Environmental Assessment of Televisions*
- Mobile Phones: *UL 110 Edition 2-2017 Standard for Sustainability for Mobile Phones*
- Photovoltaic panels: NSF 457

The following comparison of the standards used by EPEAT with the CFP Survey questions and response options shows where alignment occurs.

CFP Survey Alignment with EPEAT Criteria

CFP 2018 Survey Questions	Relevant CFP Survey response option(s) or relationship	Product Categories, Standards, and Relevant Sections					
		Imaging Equipment	Televisions	Mobile Phones	Servers	PC&D Revision	PV
		IEEE 1680.2	IEEE 1680.3	UL 110	NSF 426	IEEE 1680.1: 2018	NSF 457

MANAGEMENT STRATEGY								
M1	Does your company have a chemicals policy that, in addition to avoiding CoHCs, includes an explicit preference for the use of safer alternatives? (8 points)	Chemicals policies that prefer safer chemicals in products			7.3.1	6.2.5, 6.2.6	4.1.8.1	5.1.5, 5.1.6
M3	How does your company advocate externally for the use of safer chemicals? (4 points)	M3c				6.2.6		5.1.6

CHEMICAL INVENTORY								
I1	What is the scope of chemicals of concern you restrict in your products and manufacturing processes? (5 points)	All chemicals of concern are relevant.				6.2.5		5.1.5
I3	What chemical information does your company collect from suppliers? (5 points)	I3d & e	4.1.8.1	4.1.9.1	7.4.1, 7.4.2	6.2.1, 6.2.2, 6.2.3, 6.2.4	4.1.9.1, 4.1.9.2, 4.1.9.3	5.1.1, 5.1.2, 5.1.3, 5.1.4
I4	For what percentage of products sold by your company do you collect full chemical ingredient information? (5 points)	I4			7.4.1, 7.4.2	6.2.1, 6.2.2, 6.2.3, 6.2.4	4.1.9.1, 4.1.9.2, 4.1.9.3	5.1.1, 5.1.2, 5.1.3, 5.1.4
I5	What capabilities does your company have for managing data on chemical ingredients in its products? (5 points)	I5			7.4.1, 7.4.2	6.2.1, 6.2.2, 6.2.3, 6.2.4	4.1.9.1, 4.1.9.2, 4.1.9.3	5.1.1, 5.1.2, 5.1.3, 5.1.4
I6	How does your company ensure compliance with your chemicals requirements? (5 points)	I6 relates to any criteria relating to Conformance Assurance System (CAS) or Conformance Assurance Process (CAP).	4.1.1.1, 4.1.2.1, 4.1.3.2, 4.1.4.1, 4.1.5.1, 4.1.5.2, 4.1.6.1, 4.1.6.2, 4.1.6.3, 4.1.8.1, 4.8.1.1	4.1.1.1, 4.1.2.1, 4.1.3.2, 4.1.4.1, 4.1.5.1, 4.1.6.1, 4.1.7.1, 4.1.7.2, 4.1.7.3, 4.1.8.1, 4.1.9.1, 4.8.1.1	7.2.1, 9.1.1, 9.2.2, 9.2.3, 9.2.5	6.1.1, 6.1.3, 6.1.4, 6.1.6, 6.2.1, 8.1.1	4.1.1.1, 4.1.2.1, 4.1.4.1, 4.1.5.1, 4.1.5.2, 4.1.6.1, 4.1.6.2, 4.1.7.1, 4.1.9.1, 4.7.1.1	5.2.2, 5.2.3, 5.2.4, 10.1.1

Alignment of the CFP Survey and Other Sustainability Frameworks

(CONTINUED)

CFP 2018 Survey Questions	Relevant CFP Survey response option(s) or relationship	Product Categories, Standards, and Relevant Sections						
		Imaging Equipment	Televisions	Mobile Phones	Servers	PC&D Revision	PV	
		IEEE 1680.2	IEEE 1680.3	UL 110	NSF 426	IEEE 1680.1: 2018	NSF 457	

FOOTPRINT MEASUREMENT								
F1	Has your company set goals for reducing CoHCs in the products you sell and measured progress toward these goals? (5 points)	F1a			7.3.1	6.2.5, 6.2.6	4.1.8.1	5.1.5, 5.1.6
F3	Over the most recent year for which you have data, how much have intentionally added CoHCs in your products changed? (8 points)	F3a or b	4.1.7.1	4.1.8.1				5.2.5
F4	How does your company assess the hazards of chemicals in its products and for what percent of your products has your company assessed these hazards?	F4a			7.3.1	6.2.5, 6.2.6	4.1.8.1	5.1.5
F5	How does your company encourage the use of safer alternatives to CoHCs? (6 points)	F5			7.3.1	6.2.5, 6.2.6	4.1.8.1	5.1.5

The Chemical Footprint Project (CFP) is a project of Clean Production Action. The founding organizations of CFP are Clean Production Action, Lowell Center for Sustainable Production at the University of Massachusetts Lowell, and Pure Strategies.

Clean Production Action is an environmental organization that advances safer alternatives to toxic chemicals through its GreenScreen® and BizNGO programs. BizNGO is a unique collaboration of businesses and NGOs working together to promote safer chemicals and drive innovation into and across supply chains and government regulations.

www.cleanproduction.org

The Lowell Center for Sustainable Production is a research institute that works collaboratively with citizens, workers, businesses, and governments to create healthy work environments, viable businesses, and thriving communities that support sustainable production and consumption.
